The production of wool for 1899 was greater than that for any previous census year. The year 1889 showed a considerable decrease compared with 1879, but the present census shows an increase of 2.9 per cent in the production of wool since 1879, and 45.0 per cent since 1889. A part of this increase is more apparent than real, owing to the fact that in 1890 the fleeces from at least 223,197 sheep were omitted from the tables but included in a general estimate of wool shorn after the census enumeration. With the exception of Pierce, all the leading wool-producing counties are in the southern and southeastern parts of the state. Ranking in the order named, they are as follows: Fond du Lac, Columbia, Richland, Waukesha, Vernon, Dane, Pierce, and Grant.

HONEY AND WAX.

Compared with the census of 1890, the present census shows a decrease of 23.9 per cent in the production of honey, and 3.0 per cent in the amount of wax. The counties reporting more than 100,000 pounds of honey as the production of 1899 were Vernon, Richland, Washington, Juneau, Dodge, and Outagamie.

HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses and dairy cows, the total number of these animals, and the average number per farm. In computing the averages, only those farms which report the kind of stock under consideration are included.

TABLE 17.—HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.			DAIRY COWS.		
	Farms reporting.	Number.	Average per farm.	Farms reporting.	Number.	Average per farm.
Total	154,769	555,756	3.6	156,136	998,397	6.4
White farmers	154,341	554,608	3.6	155,927	997,918	6.4
Colored farmers	428	1,148	2.7	209	479	2.3
Owners[1]	132,759	463,965	3.5	134,557	823,705	6.1
Managers	1,227	8,389	6.8	1,214	11,052	9.1
Cash tenants	9,314	36,619	3.9	9,112	71,159	7.8
Share tenants	11,469	46,783	4.1	11,253	92,481	8.2
Under 20 acres	6,119	9,467	1.5	6,667	13,141	2.0
20 to 99 acres	69,070	180,366	2.6	70,643	310,898	4.4
100 to 174 acres	52,361	202,102	3.9	52,053	380,419	7.3
175 to 259 acres	17,633	93,799	5.3	17,300	173,811	10.0
260 acres and over	9,586	70,022	7.3	9,473	120,128	12.7
Hay and grain	29,201	101,810	3.5	27,936	143,376	5.1
Vegetable	5,476	14,836	2.7	3,601	13,660	3.8
Fruit	509	1,136	2.2	410	1,032	2.5
Live stock	53,739	229,506	4.3	57,816	404,792	7.0
Dairy	24,803	85,965	3.5	25,246	241,548	9.6
Tobacco	2,752	10,274	3.7	2,658	15,342	5.8
Flower and plant	58	95	1.6	21	41	2.0
Miscellaneous[2]	38,231	112,145	2.9	38,448	178,606	4.6

[1] Including "part owners" and "owners and tenants."
[2] Including sugar farms and nurseries.

CROPS.

The following table gives the statistics of the principal crops grown in 1899.

TABLE 18.—ACREAGES, QUANTITIES, AND VALUES OF PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantity.	Value.
Corn	1,497,474	Bushels	63,309,810	$16,905,822
Wheat	556,614	Bushels	9,005,170	5,116,346
Oats	2,365,115	Bushels	84,040,800	17,931,685
Barley	555,747	Bushels	18,699,690	6,916,935
Rye	362,193	Bushels	5,142,606	2,443,946
Buckwheat	39,713	Bushels	489,896	288,481
Broom corn	64	Pounds	38,850	2,510
Kafir corn	88	Bushels	1,877	613
Flaxseed	11,263	Bushels	140,765	143,239
Clover seed		Bushels	91,189	392,177
Grass seed		Bushels	60,577	54,553
Hay and forage	2,397,982	Tons	3,667,212	19,267,709
Tobacco	33,830	Pounds	45,500,480	2,898,091
Hops	342	Pounds	165,346	18,020
Dry beans	12,989	Bushels	143,182	206,216
Dry pease	68,819	Bushels	1,098,819	824,603
Potatoes	256,931	Bushels	24,641,498	5,826,552
Sweet potatoes	4	Bushels	86	$99
Onions	1,230	Bushels	331,662	154,310
Chicory	11	Pounds	84,000	289
Miscellaneous vegetables	38,348			2,066,324
Maple sugar		Pounds	4,180	400
Maple sirup		Gallons	6,625	6,478
Sorghum cane	2,399	Tons	[1]952	2,716
Sorghum sirup		Gallons	160,414	61,728
Sugar beets	34	Tons	233	937
Small fruits	12,389			835,119
Grapes	[2]341	Centals	5,715	[3]15,173
Orchard fruits	[2]55,009			[4]267,391
Nuts				1,460
Forest products				6,109,033
Flowers and plants	194			270,872
Seeds	67			15,336
Nursery products	736			85,087
Willows	([5])			100
Miscellaneous	201			13,099
Total	8,270,127			88,142,349

[1] Sold as cane.
[2] Estimated from number of vines or trees.
[3] Including value of raisins, wine, etc.
[4] Including value of cider, vinegar, etc.
[5] Less than 1 acre.

Of the total value of crops, cereals contributed 55.1 per cent; hay and forage, 21.9 per cent; vegetables, including potatoes, sweet potatoes, and onions, 9.1 per cent; forest products, 6.9 per cent; tobacco, 3.3 per cent; fruits and nuts, 1.3 per cent; dry beans and pease, 1.2 per cent; and all other products, 1.2 per cent.

The average values per acre of the principal crops are as follows: Flowers and plants, $1,396; onions, $125; nursery products, $116; tobacco, $86; small fruits, $67; miscellaneous vegetables, $54; hops, $53; broom corn, $39; sweet potatoes, $25; potatoes, $23; dry beans, $16; flaxseed, $13; dry pease, $12; cereals, $9; hay and forage, $8; and orchard fruits, $5. The crops yielding the highest average returns per acre were grown upon very highly improved land. Their production required a relatively great amount of labor, and large expenditures for fertilizers.

CEREALS.

The following table is a statement of the changes in cereal production since 1849.

TABLE 19.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899.

PART 1.—ACREAGE.

Year.[1]	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	555,747	39,713	1,497,474	2,365,116	362,193	556,614
1889	474,914	77,458	1,120,341	1,627,151	275,058	744,080
1879	204,335	34,117	1,015,393	955,597	169,692	1,948,160

PART 2.—BUSHELS PRODUCED.

Year.[1]	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	18,699,690	489,895	53,309,810	84,040,800	5,142,606	9,005,170
1889	15,225,872	1,064,178	34,024,216	60,739,052	4,250,582	11,698,922
1879	5,043,118	299,107	34,230,579	32,905,320	2,298,513	24,884,689
1869	1,645,019	408,897	15,033,998	20,180,016	1,325,294	25,606,344
1859	707,307	38,987	7,517,300	11,059,260	888,544	15,657,458
1849	209,692	79,878	1,988,979	3,414,672	81,253	4,286,131

[1] No statistics of acreage were secured prior to 1879.

The total number of acres in cereals was 4,319,002 in 1889, and 5,376,856 in 1899, an increase of 24.5 per cent. The rates of increase in acreage for the last decade were: Oats, 45.4 per cent; corn, 33.7 per cent; rye, 31.7 per cent; and barley, 17.0 per cent. The area devoted to wheat decreased 25.2 per cent, and the acreage in buckwheat, 48.7 per cent.

Of the total acreage in 1899, oats occupied 44.0 per cent; corn, 27.0 per cent; wheat, 10.4 per cent; barley, 10.3 per cent; rye, 6.7 per cent; and buckwheat, 0.7 per cent. Oats were grown in 1899 by 138,706 farmers, or 81.7 per cent of the total number in the state; corn, by 127,900, or 75.3 per cent; and wheat, by 79,695, or 47.0 per cent.

The southern counties of Dane, Grant, Lafayette, Green, Dodge, and Iowa produced over one-third of the corn and more than one-fifth of the oats grown in the state. St. Croix, Buffalo, Pierce, Trempealeau, Polk, and Jackson counties, in the western part, reported over one-fifth of the wheat crop; and Dodge, Fond du Lac, Washington, Sheboygan, and Calumet counties, in the eastern part, produced over one-half of the total barley crop.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 are shown in the following table.

TABLE **20**.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900	1890	1899	1889
Apples	2,557,265	1,383,070	303,373	1,591,747
Apricots	978	758	57	38
Cherries	273,740	75,670	31,067	22,712
Peaches	6,967	387	209	12
Pears	26,766	5,977	1,540	4,071
Plums and prunes	94,338	18,451	12,166	3,223

In the last ten years, the total number of trees increased from 1,484,313 to 2,960,054, or a gain of 99.4 per cent. The number of peach trees reported in 1900 was over 18 times as great as that reported in 1890. The rates of increase for other fruits are: Plum and prune trees, 411.3 per cent; cherry trees, 261.8 per cent; pear trees, 347.8 per cent; apple trees, 84.9 per cent; and apricot trees, 29.0 per cent.

Of the total number of trees reported in 1900, 86.1 per cent were apple trees; 9.2 per cent, cherry trees; 4.7 per cent, apricot, peach, pear, plum and prune, and unclassified fruit trees. The latter class, which is not included in the table, numbered 10,074 and yielded 188 bushels of fruit. The counties in the central and southern parts of the state report by far the largest numbers of fruit trees.

The value of orchard fruits given in Table 18 includes the value of 604 barrels of cider, 321 barrels of vinegar, and 2,670 pounds of dried and evaporated fruits.

SMALL FRUITS.

The total area used in the cultivation of small fruits in 1899 was 12,389 acres, distributed among 26,237 farms. Of this total, 5,821 acres, or 47.0 per cent, was devoted to cranberries, yielding 111,098 bushels, an average of 19.1 bushels per acre. Their production was entirely confined to nine counties, most of which are situated in the south central portion of the state. Wood and Waushara counties report 64.3 per cent of the total cranberry production, from 61.5 per cent of the total acreage.

To strawberries 14,246 farmers devoted 3,508 acres, yielding 7,343,740 quarts. The acreages and productions of the other berries were as follows: Raspberries and Logan berries, 1,616 acres and 2,314,920 quarts; currants, 667 acres and 1,153,190 quarts; blackberries and dewberries, 411 acres and 644,880 quarts; gooseberries, 177 acres and 255,590 quarts; and other small fruits, 189 acres and 191,570 quarts.

VEGETABLES.

The total area used in the cultivation of vegetables, including potatoes, sweet potatoes, and onions, in 1899, was 296,513 acres. Of this amount, 86.7 per cent was devoted to potatoes and sweet potatoes; 0.4 per cent, to onions; and 12.9 per cent, to miscellaneous vegetables. Potatoes were raised throughout the state, but the southern counties of Portage, Waushara, Waupaca, Adams, Milwaukee, and Columbia reported 32.3 per cent of the total acreage. Of the 169,795 farms in the state, 145,463, or 85.7 per cent, reported that they cultivated 256,931 acres, yielding 24,641,498 bushels.

Of the 38,348 acres devoted to miscellaneous vegetables no detailed reports were received for the products grown on 23,087 acres. Of the 15,261 acres concerning which detailed reports were received, 4,400 were devoted to cabbages; 3,257, to sweet corn; 2,214, to pease; 1,266, to tomatoes; 999, to cucumbers; 600, to watermelons; 573, to turnips; 539, to beets; 457, to muskmelons; 265, to carrots; 238, to celery; and 453, to other vegetables.

TOBACCO.

Tobacco was grown in 1899 by 6,919 farmers, on 38,830 acres, an average of 4.9 acres for each farm reporting. On this area they produced 45,500,480 pounds, a gain in ten years of 96.2 per cent in acreage, and of 134.7 per cent in production. The crop has increased rapidly in every decade since 1849, when a production of 1,268 pounds was reported. In 1859 the production was 87,340 pounds; in 1869, 960,813 pounds; in 1879, 10,608,423 pounds; and in 1889, 19,389,166 pounds.

The average yield per acre in 1889 was 1,124.6 pounds, while in 1899 it was 1,345.0 pounds. The total value of the crop in the latter year was $2,898,091, an average of $418.86 for each farm reporting, and of $85.67 per acre. The average value per pound was 6.4 cents.

The crop was grown in 46 counties of the state, Rock county leading, with 9,988 acres, Vernon and Columbia counties being next in rank. These three counties together reported 47.0 per cent of the entire acreage, and 45.6 per cent of the total production.

SORGHUM CANE.

The present census shows that in 1899 sorghum cane was grown by 4,889 farmers on 2,399 acres, an average of 0.49 acres for each farm reporting. From this area they sold 952 tons of cane for $2,716, and from the remaining product manufactured 160,414 gallons of sirup, valued at $61,728. This was a decrease in acreage from 1889 of 30.5 per cent. The total value of sorghum-cane products was $64,444, an average of $13.18 for each farm reportiug and of $26.86 per acre.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 194 acres, and the value of the products sold therefrom was $270,872. These flowers and plants were grown by 193 farmers and florists. Of this number, 128 made commercial floriculture their principal business. They had invested in the aggregate $880,835, of which $490,000 represents the value of the land and the improvements other than buildings; $353,615, that of buildings; $28,670, that of implements and machinery; and $8,550, that of live stock. Their sales of flowers and plants amounted to $257,238, and of other products to $19,110. The expenditure for labor was $49,187, and for fertilizers $2,850. The average income for each farm reporting, including products fed to live stock, was $2,175.

In addition to the 128 principal florists' establishments, 491 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 519,053 square feet, making, with the 711,427 belonging to the florists' establishments, a total of 1,230,480 square feet.

NURSERIES.

The total value of nursery stock sold in 1899 was $85,087, reported by the operators of 117 farms and nurseries. Of this number, 30 derived their principal income from the nursery business. They had 3,523 acres of land, valued at $175,350; buildings worth $52,800; implements and machinery worth $8,405; and live stock worth $5,315. The value of their products not fed to live stock in 1899 was $76,797, of which $66,737 represents the value of nursery stock, and $10,060, that of other products. They expended $17,180 for labor, and $405 for fertilizers. The average income for each farm reporting, including products fed to live stock, was $2,671.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $10,468,610, an average of $62 per farm. The average was highest on the most intensively cultivated farms, being $573 for nurseries, $384 for florists' establishments, $212 for fruit farms, $84 for tobacco farms, $79 for sugar farms, $72 for dairy and live-stock farms, $60 for vegetable farms, and $58 for hay and grain farms. "Managers" expended on an average $350; "cash tenants," $83; "share tenants," $83; and "owners," $54. White farmers expended $62 per farm, and colored farmers, $7.

Fertilizers purchased in 1899 cost $294,320, an average of only $2 per farm, but an increase since 1890 of 179.8 per cent. The average expenditure was $22 for florists' establishments, $14 for nurseries, $5 for vegetable farms, $3 for fruit and tobacco farms, $2 for live-stock and for hay and grain farms, and $1 for dairy farms.

INDIAN RESERVATIONS.

The Indian reservations in Wisconsin on which agriculture was carried on in 1899, are La Pointe, Menominee, Oneida, and Stockbridge. The Stockbridge are self-supporting, but take little interest in agriculture; a few, however, have good farms. The Menominee and Chippewa, on the Menominee and La Pointe reservations, respectively, derive most of their support from the sale of their timber, although a few of them carry on agriculture on a small scale. The Menominee are dependent upon Government rations for 20.0 per cent of their subsistence.

LA POINTE RESERVATION.

La Pointe, or Bad River, reservation is situated in the extreme northern part of Wisconsin, in Ashland county, and comprises an area of 194 square miles. The land is well adapted to agriculture and produces abundantly when properly cultivated. There is also considerable timber on the reserve.

The Indians at Bad River are a portion of the Lake Superior band of Chippewa (Algonquian) with a population of 627. These Indians do not take much interest in agriculture, and it is extremely difficult to induce them to build permanent homes and to work. Here and there some have cleared small patches on their allotments and have planted gardens. They have a splendid opportunity to till the soil, but as long as they can derive an income from selling their pine timber they will do little farming.

The four Indian farmers at Bad River reserve raised a crop of hay, consisting of clover and other tame grasses; one also had 4 acres in oats, another a small patch of corn. All raised vegetables of some kind, and three had several acres of potatoes. The largest area under cultivation was 40 acres, the smallest 10 acres.

Their live stock consisted principally of farm horses. One Indian had 21 horses valued at $2,000, 62 swine, and 40 chickens, and reported sales of live stock and animal products to the amount of $420. The three remaining farmers owned no swine or chickens, but one possessed a dairy cow and reported a good production of milk and butter.

MENOMINEE AND STOCKBRIDGE RESERVATIONS.

Menominee and Stockbridge reservations, embracing areas of 362 and 18¼ square miles, respectively, are located in the northeastern part of Wisconsin, the former in Shawano and Oconto counties, the latter in Shawano county, adjoining the Menominee reserve on the southwest. Menominee is largely timbered with hemlock, pine, elm, maple, and other valuable wood, yet the arable land is fertile and yields large returns when properly cultivated. Stockbridge also contains much farming land in addition to timber.

The Menominee (Algonquian) are an aboriginal Wisconsin tribe and have a present population of 1,487. Their principal occupations are lumbering and farming.

The Stockbridge and Munsee tribes, of Algonquian stock, inhabit the reserve of the first named. These tribes originally lived in New England; later they moved to western New York and thence to Wisconsin; they are nonconsolidated, and number 376. Those among them who cultivate the soil have excellent crops to show for their labor, but most of them have not made an effort in this direction.

The principal crops raised on these two reserves are oats and corn; a few acres are also sown to wheat, rye, and buckwheat. The hay crop consists of clover and other tame grasses. All of the 37 Indian farmers raised patches of potatoes, while some also had other garden vegetables. The majority cultivated from 10 to 50 acres, while two had 110 and 130 acres, respectively, under cultivation.

Most farms are well supplied with work horses; many own dairy cows, and a few also have beef cattle. Chickens and swine are raised quite generally among these farmers.

ONEIDA RESERVATION.

Oneida reservation, now existing as such only in name, is situated in the extreme east-central part of Wisconsin, in Brown and Outagamie counties. The entire area, 102 square miles, has been allotted, with the exception of a small tract for school purposes. The land is generally adapted to agriculture, though there are a few swamps on the reserve.

The Oneida (Iroquoian) were formerly a portion of the Six Nations of New York, where they resided before being sent to Wisconsin. Their present population is 1,704. They have long been a self-supporting, agricultural people, and all are engaged in farming. Their farms are well cultivated, and are supplied with good buildings, plenty of implements, and stock.

Their principal crops are oats, wheat, and corn in the order named, while small quantities of rye, buckwheat, and barley are also raised. Nearly all of the 309 Indian farmers planted patches of potatoes, but other garden vegetables were not reported. A few have small orchards of apple, plum, and cherry trees. The majority of Oneida farmers cultivated from 5 to 60 acres. Their proximity to several large cities gives them an excellent market for all farm produce.

The live stock of the Oneidas consists principally of farm horses of a good American grade and dairy cows, the latter being quite common among them. Chickens and swine are also found on most farms.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 219. WASHINGTON, D. C. July 1, 1902.

AGRICULTURE.

OHIO.

Hon. William R. Merriam,
Director of the Census.

Sir: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the state of Ohio, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

> The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It includes also the house in which the farmer resides, and all other buildings used by him in connection with his farming operations.

The farms of Ohio, June 1, 1900, numbered 276,719 and were valued at $1,036,615,180. Of this amount, $219,451,470, or 21.2 per cent, represents the value of buildings, and $817,163,710, or 78.8 per cent, the value of the land and improvements other than buildings. On the same date the value of farm implements and machinery was $36,354,150, and of live stock, $125,954,616. These values, added to that of the farms, give $1,198,923,946, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $257,065,826, of which amount $100,213,468, or 39.0 per cent, represents the value of animal products, and $156,852,358, or 61.0 per cent, the value of crops, including forest products. The "total value of farm products" for 1899 exceeds that for 1889 by $123,833,328, or 92.9 per cent, but a part of this gain is doubtless due to a more complete enumeration in 1900 than in 1890.

The "gross farm income" is obtained by deducting from the total value of farm products the value of the products fed to live stock on the farms of the producers. In 1899 the reported value of products fed was $56,245,050, leaving $200,820,776 as the gross farm income for that year. The ratio which this amount bears to the "total value of farm property" is referred to in this bulletin as the "percentage of gross income upon investment." For Ohio in 1899 it was 16.8 per cent.

As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

The statistics presented in this bulletin will be treated in greater detail in the report on agriculture in the United States. The present publication is designed to present a summarized advance statement for Ohio.

Very respectfully,

L. G. Powers.

Chief Statistician for Agriculture.

AGRICULTURE IN OHIO.

GENERAL STATISTICS.

Ohio has a total land surface of 40,760 square miles, or 26,086,400 acres, of which 24,501,985 acres, or 93.9 per cent, are included in farms.

The surface of the state is a rolling plain, with a gradual slope toward the southwest. A high ridge extending across the northern part forms a watershed, dividing the drainage basins of Lake Erie on the north and the Ohio River on the south. In the border counties adjacent to the Ohio River, the surface is broken by hills.

The soil is generally adapted to agriculture and to the cultivation of all products permitted by the latitude. In the southeast it is formed directly from the underlying and outcropping rocks, while elsewhere it is composed of drift material, including the limestone soil in the west, the clay formation of the uplands, and the northwestern swamp lands. The vast body of water in Lake Erie modifies the climate and renders the northern belt especially adapted to the culture of orchards and vineyards. The large cities furnish good markets, and the excellent railway and water transportation facilities have been important factors in the agricultural development of the state.

NUMBER AND SIZE OF FARMS.

The following table gives, by decades since 1850, the number of farms, the total and average acreage, and the percentage of farm land improved.

TABLE 1.—FARMS AND FARM ACREAGE: 1850 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	276,719	24,501,985	19,244,472	5,257,513	88.5	78.5
1890	251,430	23,352,408	18,338,824	5,013,584	92.9	78.5
1880	247,189	24,529,226	18,081,091	6,448,135	99.2	73.7
1870	195,953	21,712,420	14,469,133	7,243,287	110.8	66.6
1860	179,889	20,472,141	12,625,394	7,846,747	113.8	61.7
1850	143,807	17,997,493	9,851,493	8,146,000	125.2	54.7

The number of farms nearly doubled in the half century, and increased 10.1 per cent in the last decade. The total farm area also increased steadily, except during the decade ending in 1890, while the improved area more than doubled. The percentage of farm land improved shows a rapid increase for every decade except the last, when there was neither gain nor loss. The average area of farms has decreased steadily throughout the fifty years.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1850.

TABLE 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND OF FARM PRODUCTS: 1850 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$1,198,923,946	$1,036,615,180	$36,354,150	$125,954,616	$257,065,826
1890	1,195,688,864	1,050,031,828	29,475,346	116,181,690	133,232,498
1880	1,261,726,263	1,127,497,353	30,521,180	103,707,730	156,777,152
1870[2]	1,200,458,541	1,054,465,226	25,692,787	120,300,528	[3]198,256,907
1860	776,056,642	678,132,991	17,538,832	80,384,819	....
1850	415,630,929	358,758,603	12,750,585	44,121,741	....

[1] For year preceding that designated.

[2] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other years they must be diminished one-fifth.

[3] Includes betterments and additions to live stock.

Though the total value of farm property in 1900 was nearly three times as great as in 1850, an increase of only 0.3 per cent is shown for the last decade. This low rate is due to a decrease of $13,416,648, or 1.3 per cent, in the value of farms. A gain of $6,878,804, or 23.3 per cent, is shown for the value of implements and machinery, and of $9,772,926, or 8.4 per cent, for the value of live stock. The apparent gain of $123,833,328, or 92.9 per cent, in the value of farm products, and the gain shown for implements and machinery, are due in part to a more complete enumeration in 1900 than in previous census years.

COUNTY STATISTICS.

Table 3 gives an exhibit of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS, AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH VALUE OF PRODUCTS OF 1899 NOT FED TO LIVE STOCK, AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Value of products not fed to live stock.	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.

In nearly all counties the number of farms increased in the last decade, the six northern counties of Ashland, Holmes, Medina, Morrow, Sandusky, and Williams alone showing decreases in the total farm acreage. The smaller area of improved land reported in many of the counties is due to the use of a more strict construction of the term "improved land" by the Twelfth than by any preceding census. The average size of farms for the state is 88.5 acres, and varies from less than 60 to more than 120 acres.

A little less than one-half of the counties in the state report increases in the total value of farms, the increases being generally in the western and northeastern counties. In the value of implements and machinery the majority of counties show an increase, slight decreases being reported by only eight counties. The value of live stock has decreased in one-fourth of the counties.

FARM TENURE.

Table 4 gives a comparative statement of farm tenure for 1880, 1890, and 1900. The farms operated by tenants are divided into two groups, designated as farms operated by "cash tenants," who pay a rental in cash or a stated amount of labor or farm produce, and "share tenants," who pay as rental a stated share of the products.

In Table 5 the tenure of farms for 1900 is given by race of farmer, the farms operated by owners being subdivided into four groups, designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it, and the other, or others, owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive for their supervision and other services a fixed salary from the owners.

TABLE 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 TO 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.
1900	276,719	200,788	24,051	51,880	72.5	8.7	18.8
1890	251,430	193,895	18,947	38,588	77.1	7.5	15.4
1880	247,189	199,562	14,834	32,793	80.7	6.0	13.3

[1] Including "part owners," "owners and tenants," and "managers."

TABLE 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

PART 1.—NUMBER OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	276,719	169,370	23,730	4,261	3,427	24,051	51,880
White	274,750	168,369	23,509	4,244	3,399	23,839	51,390
Colored[1]	1,969	1,001	221	17	28	212	490

PART 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	100.0	61.2	8.6	1.5	1.2	8.7	18.8
White	100.0	61.3	8.6	1.5	1.2	8.7	18.7
Colored[1]	100.0	60.8	11.2	0.9	1.4	10.8	24.9

[1] Comprising 1 Chinese, 2 Indians, and 1,966 negroes.

There was a slight decrease in the number of farms operated by owners in the decade from 1880 to 1890, but an increase of 3.6 per cent is shown for the last decade. The relative number of owners has, however, decreased each decade. Gains are shown for both tenant groups, the rates for the twenty years being 62.1

per cent for cash tenants and 58.2 per cent for share tenants.

Of the farms of the state, 99.3 per cent are operated by white farmers and 0.7 per cent by colored. The percentages of tenure for white and colored farmers do not differ greatly, a somewhat larger portion of the negroes being tenants.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the number of farms conducted by the last-named group is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

TABLE 6.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	276,719	88.5	24,501,985	100.0	$1,198,923,946	100.0
White	274,750	88.8	24,396,326	99.6	1,194,618,103	99.6
Colored[1]	1,969	53.7	105,659	0.4	4,306,843	0.4
Owners	169,370	83.1	14,070,387	67.4	670,537,844	56.9
Part owners	23,730	98.1	2,326,729	9.5	119,421,064	9.9
Owners and tenants	4,261	118.2	503,596	2.1	22,509,403	1.9
Managers	3,427	164.8	564,863	2.3	31,953,870	2.7
Cash tenants	24,051	82.0	1,971,501	8.0	107,567,883	9.0
Share tenants	51,880	97.6	5,064,910	20.7	246,933,882	20.6

[1] Including 2 Indians and 1 Chinese.

TABLE 7.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY RACE OF FARMER AND BY TENURE.

RACE OF FARMER, AND TENURE.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900.				AVERAGE VALUES PER FARM OF—	Per cent of gross income on total investment in farm property.
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	
The State	$2,953	$793	$132	$455	$726	16.8
White	2,963	796	132	467	729	16.7
Colored[1]	1,601	291	61	234	402	18.4
Owners	2,601	796	126	437	670	16.9
Part owners	3,509	829	150	544	888	17.6
Owners and tenants	3,555	962	169	607	889	16.8
Managers	6,750	1,639	186	749	1,092	11.7
Cash tenants	3,206	691	127	448	740	16.6
Share tenants	3,430	748	136	446	789	16.6

[1] Including 2 Indians and 1 Chinese.

The average area, value of property, and value of products are very much lower for colored than for white farmers. The higher per cent of gross income for colored farmers does not indicate superior farm management, but is due to the smaller average area, more intensive cultivation, and to the low value of farm property of the colored farmers.

The farms of managers, though fewest in number, have the largest average area and the highest average values, but as the values are high, the per cent of gross income is lowest for this group. The averages are lowest for owners and cash tenants.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	276,719	88.5	24,501,985	100.0	$1,198,923,946	100.0
Under 3 acres	2,531	1.7	4,319	([1])	3,034,248	0.3
3 to 9 acres	14,816	5.9	87,753	0.4	18,458,860	1.6
10 to 19 acres	18,115	13.7	248,359	1.0	27,962,749	2.3
20 to 49 acres	57,566	34.3	1,972,566	8.0	120,224,919	10.0
60 to 99 acres	89,774	73.9	6,636,508	27.1	329,132,854	27.5
100 to 174 acres	67,258	128.8	8,663,663	35.4	402,364,342	33.6
175 to 259 acres	18,361	201.5	3,699,942	15.1	166,973,652	13.9
260 to 499 acres	7,218	325.6	2,350,226	9.6	100,066,949	8.4
500 to 999 acres	916	627.0	574,368	2.3	23,174,633	1.9
1,000 acres and over	164	1,611.5	264,281	1.1	7,530,740	0.6

[1] Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900.				AVERAGE VALUES PER FARM OF—	Per cent of gross income on total investment in farm property.
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	
The State	$2,963	$793	$132	$455	$726	16.8
Under 3 acres	495	676	46	83	332	27.7
3 to 9 acres	624	471	49	102	224	18.0
10 to 19 acres	879	473	55	137	266	17.2
20 to 49 acres	1,294	496	78	221	387	18.5
50 to 99 acres	2,425	721	128	392	650	17.7
100 to 174 acres	4,146	1,028	178	630	989	16.5
175 to 259 acres	6,606	1,308	224	956	1,412	15.5
260 to 499 acres	10,320	1,802	278	1,464	2,001	14.4
500 to 999 acres	19,508	2,603	372	2,817	3,483	13.8
1,000 acres and over	36,890	3,817	543	4,669	6,479	14.1

The group of farms containing from 50 to 99 acres contains the largest number of farms, but the next largest group constitutes a larger percentage of the total acreage and value.

For the two groups containing less than 10 acres per farm, the average values given in Table 9 are relatively high, as these groups include most of the florists' establishments and a number of city dairies. It should be borne in mind that the income from these industries is determined, not so much by the acreage of land used, as by the amount of capital invested in buildings and implements and the amounts expended for labor and fertilizers.

The average gross incomes for the various groups classified by area are as follows: Farms under 3 acres, \$194.48; 3 to 9 acres, \$37.85; 10 to 19 acres, \$19.40; 20 to 49 acres, \$11.30; 50 to 99 acres, \$8.80; 100 to 174 acres, \$7.68; 175 to 259 acres, \$7.01; 260 to 499 acres, \$6.15; 500 to 999 acres, \$5.55; 1,000 acres and over, \$4.02.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading features of the statistics relating to farms classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop and constitutes at least 40 per cent of the total value of products not fed to live stock, the farm is classified as a "hay and grain" farm. If vegetables are the leading crop, constituting 40 per cent of the value of such products, it is a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive 40 percent of their income from any one class of products. Farms with no income in 1899 are classified according to the agricultural operations upon other farms in the same locality.

TABLE 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	276,719	88.5	24,501,985	100.0	\$1,198,923,946	100.0
Hay and grain	80,809	100.6	8,131,676	33.2	423,134,731	35.3

Nursery products	5,179	1,682	164	210	3,557	49.2
Miscellaneous	2,038	712	110	326	527	16.5

For the several classes of farms the average values per acre of products not fed to live stock are as follows: For farms deriving their principal income from flowers and plants, \$493.12; nursery products, \$48.34; vegetables, \$19.49; fruits, \$15.50; tobacco, \$15.09; dairy produce, \$10.29; hay and grain, \$8.01; live stock, \$7.58; miscellaneous, \$7.53; and sugar, \$7.19.

The wide variations shown in the averages and in the percentages of gross income are largely due to the fact that in computing gross income no deduction is made for expenditures. For florists' establishments, nurseries, and market gardens, the average expenditure for such items as labor and fertilizers represents a far larger percentage of the gross income than for "hay and grain," "live stock," or "miscellaneous" farms. Were it possible to present the average net incomes the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.

TABLE 13.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$2,953	$793	$132	$455	$726	16.8
$0	1,530	395	24	236	....	....
$1 to $49	621	264	23	74	34	3.4
$50 to $99	655	303	29	90	74	6.9
$100 to $249	875	367	48	154	175	12.2
$250 to $499	1,610	530	86	276	370	14.8
$500 to $999	2,958	833	145	473	720	16.3
$1,000 to $2,499	5,612	1,311	225	810	1,415	17.8
$2,500 and over	13,048	2,452	385	1,841	3,814	21.5

The absence of income in the first group is due in part to the fact that the enumerators could not always secure complete reports for farms where changes in ownership or tenancy had occurred shortly prior to the date of enumeration. The persons in charge of such farms on June 1, 1900, frequently could not give definite information concerning the products of the preceding year. The same statement is true also of some of the farms with reported incomes of less than $100. To this extent the reports fall short of giving a complete exhibit of farm income in 1899. Other farms with little or no reported incomes are doubtless the suburban or summer homes of city merchants and professional men, who derive their principal incomes from other than agricultural pursuits.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the Twelfth Census. The age grouping for neat cattle was determined in accordance with their present and prospective relations to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits a very close comparison with the figures published in previous census reports.

The total value of live stock on farms, June 1, 1900, was $125,954,616, of which 39.8 per cent represents the value of horses; 19.6 per cent, that of dairy cows; 17.3 per cent, that of other neat cattle; 9.4 per cent, that of swine; 8.7 per cent, that of sheep; 4.1 per cent, that of poultry; 0.8 per cent, that of mules and asses; and 0.3 per cent, that of all other live stock.

Table 14 presents a summary of live-stock statistics.

TABLE 14.—DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age in years.	ON FARMS.			NOT ON FARMS.
		Number.	Value.	Average value.	Number.
Calves	Under 1	494,584	$4,186,575	$8.46	6,167
Steers	1 and under 2	223,946	4,300,265	19.20	1,336
Steers	2 and under 3	144,725	4,571,321	31.59	1,334

Horses	2 and over	755,549	45,725,947	60.52	186,561
Mule colts	Under 1	1,464	46,525	31.78	20
Mules	1 and under 2	1,321	60,244	45.60	101
Mules	2 and over	13,986	834,442	59.66	4,651
Asses and burros	All ages	250	18,981	75.92	212
Lambs	Under 1	1,372,378	2,370,851	1.73	2,252
Sheep (ewes)	1 and over	2,090,093	6,790,239	3.25	4,327
Sheep (rams and wethers).	1 and over	558,157	1,795,218	3.22	2,814
Swine	All ages	3,188,563	11,813,168	3.70	97,226
Goats	All ages	5,432	16,975	3.13	1,149
Fowls:[1]					
Chickens[2]	....	14,269,525	5,085,921	....	....
Turkeys	....	362,924			
Geese	....	179,665			
Ducks	....	206,238			
Bees (swarms of)	....	151,391	402,561	2.66	....
Value of all live stock.	....	....	125,954,616	....	....

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.
[2] Including Guinea fowls.

No reports were secured of the value of live stock not on farms, but it is probable that such animals have higher average values than those on farms. Allowing the same averages, however, the value of domestic animals not on farms is $13,878,677. Exclusive of poultry and bees not on farms the value of all live stock in the state is, approximately, $139,833,293.

CHANGES IN LIVE STOCK ON FARMS.

The following table shows the changes since 1850 in the numbers of the most important domestic animals.

TABLE 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS: 1850 TO 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	818,239	1,235,074	878,205	17,021	2,648,250	3,188,563
1890	794,833	968,554	880,677	18,858	4,060,729	3,275,922
1880	767,043	1,093,143	736,478	19,481	4,902,486	3,141,333
1870	654,390	781,827	609,722	16,065	4,928,635	1,728,968
1860	676,585	958,155	625,346	7,194	3,546,767	2,251,653
1850	544,499	814,448	463,397	3,423	3,942,929	1,964,770

[1] Lambs not included.

For the last half century all classes of live stock show fluctuations in numbers from decade to decade. Larger numbers of every class except sheep are shown for 1900 than for 1850, but for the last decade, only neat cattle show an increase. The decreases since 1890 were general throughout the state, and were due in part to the high prices prevailing just before the enumeration, which led many farmers to reduce their flocks and herds to an unusual extent.

The increase in number of dairy cows has been constant since 1870, that year's report showing the effects of the Civil War. The number reported in 1900 is 50.3 per cent greater than in 1850, and 2.9 per cent greater than in 1890. The number of other neat cattle has increased 51.6 per cent since 1850, and 27.5 per cent since 1890. There were 89.5 per cent more horses reported in 1900 than in 1850, but 0.3 per cent fewer than in 1890. Nearly five times as many mules and asses were reported in 1900 as in 1850, but the last decade shows a decrease of 9.7 per cent. The years 1870 and 1880 show the largest numbers of sheep, the decrease in the last decade being 34.8 per cent. In 1900 there were 62.3 per cent more swine than in 1850, but 2.7 per cent less than in 1890.

In 1900 the enumerators were instructed to report no fowls under 3 months old, but in 1890 no such limitation was made. This accounts for the small increase in the number of chickens and the apparent decreases in the numbers of other classes of poultry. Compared with the census of 1890, the report of 1900 shows an increase of 4.5 per cent in the number of chickens, and a decrease of 38.0 per cent in the number of other classes of poultry. The increase in the number of eggs produced indicates conclusively that the apparent decreases in the numbers of fowls are due to a difference in the methods of enumeration in 1890 and 1900.

ANIMAL PRODUCTS.

Table 16 is a summarized statement of the animal products of 1899.

TABLE 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	20,350,721	$4,299,025
Mohair and goat hair	Pounds	469	112
Milk	Gallons	[1] 425,870,394	} [2] 25,383,627
Butter	Pounds	79,551,299	
Cheese	Pounds	1,167,001	
Eggs	Dozens	91,766,630	10,280,769
Poultry			8,847,009
Honey	Pounds	1,980,530	} 252,321
Wax	Pounds	34,620	
Animals sold			40,873,674
Animals slaughtered			10,276,931
Total value			100,213,468

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of milk sold or consumed, and of butter and cheese made.

The value of the animal products of the state for 1899 was $100,213,468. Of this value 51.0 per cent represents the value of animals sold and animals slaughtered on farms; 25.3 per cent, that of dairy produce; 19.1 per cent, that of poultry and eggs; 4.3 per cent, that of wool, mohair, and goat hair; and 0.3 per cent, that of honey and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

The value of animals sold and animals slaughtered on farms in 1899 was $51,150,605, or 25.5 per cent of the gross farm income. Of all farmers reporting live stock, 222,155, or 83.3 per cent, reported animals slaughtered on farms, and 193,642, or 72.6 per cent, reported sales of live animals, the average receipts per farm being $46.26 and $211.08, respectively.

DAIRY PRODUCE.

In 1899 the proprietors of 12,768 farms, or 4.6 per cent of the total number in the state, derived their principal income from the sale of dairy produce. The production of milk in 1899 was 98,944,998 gallons greater than in 1889, a gain of 30.3 per cent. The quantity of butter produced on farms increased 6.1 per cent, and the quantity of cheese made on farms, 9.3 per cent, the development of creameries and the increased consumption of milk and cream in cities accounting for the smallness of the increases.

Of the $25,383,627 given in Table 16 as the value of dairy produce, $15,484,849, or 61.0 per cent, represents the value of such produce sold, and $9,898,778, or 39.0 per cent, the value of that consumed on farms. Of the former amount, $8,303,626 was derived from the sale of 84,543,703 gallons of milk; $6,896,334 from 47,118,140 pounds of butter; $213,716 from 429,143 gallons of cream; and $71,173 from 1,047,202 pounds of cheese.

POULTRY AND EGGS.

Of the $19,127,778 given as the value of poultry products, 53.7 per cent represents the value of eggs produced, and 46.3 per cent the value of poultry raised. The 91,766,630 dozens of eggs reported in 1900 are 21,604,390 dozens, or 30.8 per cent, more than were reported in 1890.

WOOL.

The production of wool was greatest in 1880. There was a decrease for the last decade of 3.0 per cent. That this decrease was not so great as that shown in the number of sheep in Table 15 is due to the facts that the average weight of fleeces has increased, and that in 1890 the fleeces of at least 376,906 sheep were not included in the tables, but were given in a general estimate of wool shorn after the census enumeration.

The average weight of fleeces increased from 5.7 pounds in 1889 to 7.0 pounds in 1899, indicating improvement in the grade of sheep kept. Harrison county led in the production of wool, reporting 1,017,810 pounds for 1899, with an average weight of 8.5 pounds per fleece.

HONEY AND WAX.

The production of honey for 1899 was 1,980,530 pounds, and of wax, 34,620 pounds, a decrease in the last decade of 31.6 per cent in quantity of honey, and an increase of 3.3 per cent in quantity of wax.

HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses and dairy cows, the total number of these animals, and the average number per farm. In computing the averages presented, only those farms which report the kind of stock under consideration are included.

Table 17.—HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.			DAIRY COWS.		
	Farms reporting.	Number.	Average per farm.	Farms reporting.	Number.	Average per farm.
Total	261,788	878,205	3.5	244,405	818,239	3.3

Dry pease	506	Bushels	7,521	7,410
Potatoes	167,690	Bushels	13,709,238	5,750,058
Sweet potatoes	3,796	Bushels	249,767	158,103
Onions	6,067	Bushels	1,671,442	826,212
Miscellaneous vegetables.	98,279			5,620,024
Maple sugar		Pounds	613,990	48,736
Maple sirup		Gallons	923,519	616,490
Sorghum cane	6,037	Tons	[1]1,855	5,651
Sorghum sirup		Gallons	341,623	121,130
Small fruits	21,121			1,767,357
Grapes	[2]22,955	Centals	791,739	[3]992,746
Orchard fruits	[2]370,769			[4]6,141,118
Nuts				4,871
Forest products				5,625,897
Flowers and plants	685			1,399,957
Seeds	206			33,989
Nursery products	4,699			538,012
Willows	14			1,144
Miscellaneous	2			26,854
Total	12,008,095			156,852,358

[1] Sold as cane.
[2] Estimated from number of vines or trees.
[3] Including value of raisins, wine, etc.
[4] Including value of cider, vinegar, etc.

Of the total value of crops in 1899, corn contributed 30.6 per cent; other cereals, 27.9 per cent; hay and forage, 18.5 per cent; vegetables, including potatoes, sweet potatoes, and onions, 7.9 per cent; fruits and nuts, 5.7 per cent; forest products, 3.6 per cent; tobacco, 3.1 per cent; and all other products, 2.7 per cent.

The average values per acre of crops were as follows: Flowers and plants, $2,043.73; onions, $163.06; nursery products, $114.49; tobacco, $68.10; sweet potatoes, $41.65; potatoes, $34.31; dry pease and beans, $17.45; orchard fruits, $16.56; and cereals, $11.17.

CEREALS.

The following table is an exhibit of the changes in cereal production since 1849.

TABLE 19.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899.

PART 1.—ACREAGE.

Year.[1]	Barley.	Buck-wheat.	Corn.	Oats.	Rye.	Wheat.

1879	1,707,129	280,229	111,877,124	28,664,505	389,221	46,014,869
1869	1,715,221	180,341	67,501,144	25,347,549	846,890	27,882,159
1859	1,663,868	2,370,650	73,543,190	15,409,234	683,686	15,119,047
1849	354,358	638,060	59,078,695	13,472,742	425,918	14,487,351

[1] No statistics of acreage were secured prior to 1879.

The total area devoted to cereals in 1879 was 6,857,556 acres; in 1889, 6,785,280 acres; and in 1899, 8,214,948 acres. The total number of bushels produced in 1849 was 88,457,124, and in 1899, 245,957,765, showing an increase in fifty years of 157,400,641 bushels, or almost twice the quantity produced in 1849. The increases in acreage under cereals in the decade from 1889 to 1899, were: Wheat, 41.4 per cent, and corn, 20.0 per cent. The decreases were: Oats and barley, each 8.2 per cent; rye, 70.5 per cent; and buckwheat, 7.0 per cent.

Of the total area under cereals in 1899, 46.6 per cent was devoted to corn; 39.0 per cent to wheat; 13.6 per cent to oats; 0.4 per cent to barley; and 0.4 per cent to rye and buckwheat.

Corn, oats, and wheat were raised extensively throughout the state. Henry and Hamilton counties, in the western part, reported 13.5 per cent of the total area under rye, and Henry and Paulding counties 28.5 per cent of the total acreage devoted to barley. The largest acreages in buckwheat were in the northern section, Lucas and Ashtabula counties reporting 36.2 per cent of the total area devoted to this grain.

HAY AND FORAGE.

In 1900, 220,089 farmers, or 79.5 per cent of the total number, reported hay and forage crops. Exclusive of cornstalks, they obtained an average yield of 1.2 tons per acre. The acreage in hay and forage in 1899 was 3,015,261, or 0.8 per cent greater than ten years before.

In 1899 the acreages and yields of the various kinds of hay and forage were as follows: Wild, salt, and prairie grasses, 3,548 acres and 3,563 tons; millet and Hungarian grasses, 13,048 acres and 19,552 tons; alfalfa or lucern, 2,799 acres and 3,944 tons; clover, 617,516 acres and 773,857 tons; other tame and cultivated grasses, 2,276,898 acres and 2,627,989 tons; grains cut green for hay, 60,813 acres and 77,749 tons; crops grown for forage, 40,639 acres and 123,068 tons; cornstalks, 446,079 acres and 563,149 tons.

In Table 18 the production of cornstalks is included under "hay and forage," but the acreage is included under "corn," as the forage secured was only an incidental product of the corn crop.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 may be seen in the following table.

TABLE 20.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900	1890	1899	1889
Apples	12,952,625	10,860,613	20,617,480	13,789,278
Apricots	5,348	6,077	449	434
Cherries	697,270	368,311	192,954	117,330
Peaches	6,363,127	1,882,191	240,686	687,112
Pears	921,412	353,232	244,565	279,831
Plums and prunes	892,441	145,832	81,485	17,921

The total number of trees in the state in 1890 was 13,616,256, and in 1900, 21,832,223, an increase of 8,215,967, or 60.3 per cent, in the decade. The number of apple trees increased 19.3 per cent, and of cherry trees, 89.3 per cent, while the number of peach and pear trees in 1900 was, approximately, three times, and of plum and prune trees six times, as great as in 1890. The number of apricot trees decreased 12.0 per cent.

Of all trees reported in 1900, 59.1 per cent were apple trees; 29.1 per cent, peach trees; 4.2 per cent, pear trees; 4.1 per cent, plum and prune trees; 3.2 per cent, cherry trees; 0.3 per cent, apricot and unclassified trees. The latter class, which is not included in the table, numbered 61,579 and yielded 21,704 bushels of fruit.

The value of orchard products given in Table 18 includes the value of 400,578 barrels of cider, 71,909 barrels of vinegar, and 1,191,170 pounds of dried and evaporated fruits. Comparisons of the yield of orchard fruits, when made by decades only, are of little importance, as the crop is subject to great seasonal variations.

SMALL FRUITS.

The total area devoted to small fruits in 1899 was 21,121 acres, distributed among 49,113 farms, an average of 0.4 acre per farm. Of the total acreage, 9,373 acres, or 44.4 per cent of the total, were devoted to strawberries, yielding 17,916,080 quarts. The acreages and productions of the other berries were as follows: Raspberries and Logan berries, 6,795 acres and 8,745,950 quarts; blackberries and dewberries, 3,397 acres and 4,905,430 quarts; currants, 765 acres and 1,153,920 quarts; gooseberries, 539 acres and 767,760 quarts; and other small fruits, 252 acres and 246,890 quarts.

FLAX.

Flax was grown in 1899 by 413 farmers. The area devoted to the crop was 3,092 acres, and the yield was 29,821 bushels of seed. Large decreases are shown for the last decade, the acreage in 1899 being but one-seventh, and the production but one-fifth of that reported in 1889. The average yield per acre was 7.1 bushels of seed in 1889, and 9.6 in 1899. The average area per farm in 1899 was 7.5 acres, and the value of the crop per acre, $9.36.

The seven northern counties of Ashland, Medina, Huron, Richland, Lorain, Wayne, and Summit, ranking in the order named, reported 90.1 per cent of the total acreage. Ashland county alone reported four times the acreage of any other county, or 52.5 per cent of the total.

VEGETABLES.

The total area used in the cultivation of vegetables, including potatoes, sweet potatoes, and onions, in 1899, was 274,732 acres. Of this amount 61.0 per cent was devoted to potatoes, 35.8 per cent to miscellaneous vegetables, 1.8 per cent to onions, and 1.4 per cent to sweet potatoes.

Potatoes were reported by 190,745 farmers, or 68.9 per cent of the total number in the state. The average area per farm devoted to potatoes by the farmers reporting them was 0.9 acre, and the average yield was 81.8 bushels per acre. Potatoes were grown throughout the state generally, but the northeastern counties of Cuyahoga, Portage, Ashtabula, Stark, and Trumbull reported 20.7 per cent of the product from 18.9 per cent of the acreage.

Of the 98,279 acres used in the cultivation of other vegetables no detailed reports were received for 55,034 acres, or 56.0 per cent of the total. Of the 43,245 acres whose products were reported in detail, 16,659 were devoted to sweet corn; 10,800, to tomatoes; 6,970, to cabbages; 2,256, to muskmelons; 1,959, to watermelons; 1,432, to cucumbers; 954, to celery; 748, to pease; 306, to beans, and 1,161, to other vegetables.

TOBACCO.

The tobacco crop in Ohio, as in other states, has been subject to many fluctuations during the last fifty years. According to the census of 1850 the state produced 10,454,449 pounds in 1849. That of 1860 showed a gain over this amount of 14,638,132 pounds, or 140.0 per cent, while that of 1870 showed a falling off of 6,350,608 pounds, or 25.3 per cent. Between 1870 and 1880 there was a gain of 15,993,262 pounds, or 85.3 per cent, and between 1880 and 1890 a gain of 3,118,328 pounds, or 9.0 per cent.

In 1899 tobacco was grown in Ohio by 16,666 farmers, who obtained from 71,422 acres a yield of 65,957,100 pounds. This was an increase in area in the last decade of 27,119 acres, or 61.2 per cent, and in production of 28.103,537 pounds, or 74.2 per cent. The total value of the crop was $4,864,191, an average, for each farm reporting, of $291.86. The average yield per acre in 1899 was 923 pounds, as against 854 pounds in 1889, and 1,001 pounds in 1879. The average value in 1899 was 7.4 cents per pound.

Tobacco was grown in 1899 in 71 counties of the state. The leading county was Montgomery, with 18,883 acres, and the second in rank was Darke county, with 11,995 acres. These two counties together contributed 43.2 per cent of the acreage and 43.5 per cent of the production of the state, and with Preble, Warren, Miami, and Brown, furnished 77.6 per cent of the entire area, and 78.7 per cent of the entire production of the state.

SORGHUM CANE.

The present census shows that in 1899 sorghum cane was raised by 12,418 farmers, on 5,037 acres, an average of 0.4 acre for each farm reporting. From this area were sold 1,855 tons of cane for $5,651, and from the remaining product manufactured 341,523 gallons of sirup, valued at $121,130. This was a decrease in acreage from 1889 of 32.9 per cent, and in production of 37.6 per cent. The total value of all sorghum products was $126,781, an average of $10.21 for each farm reporting. The crop was distributed over 88 counties of the state, Lawrence county leading with 756 acres.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 685 acres, and the value of the products sold therefrom was $1,399,957. These flowers and plants were grown by 662 farmers and florists, and of this number, 505 made commercial floriculture their principal business. They had invested in the aggregate $2,970,336, of which $1,568,354 represents the value of land and improvements other than buildings; $1,308,956 the value of buildings; $67,850 that of implements and machinery; and $25,176 that of live stock. Their sales of flowers and plants amounted to $1,342,470, and of other products, to $54,060. They expended for labor $273,233, and for fertilizers $11,824.

In addition to the 505 principal florists' establishments, 2,233 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 4,059,484 square feet, making, with the 3,910,706 belonging to the florists' establishments, a total of 7,970,190 square feet.

NURSERIES.

The total value of nursery products sold in 1899 was $538,012, reported by the operators of 317 farms and nurseries. Of this number, 147 derived their principal income from the nursery business. They had 10,818 acres of land, valued at $761,375; buildings worth $247,259; implements and machinery worth $24,040; and live stock worth $30,880. Their total income, exclusive of products fed to live stock, was $522,905, of which $484,539 represents the value of nursery stock, and $38,366 that of other products.

The expenditure for labor was $127,390, and for fertilizers, $4,732.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including tne value of board furnished, was $14,502,600, an average of $52 per farm. The average was highest on the most intensively cultivated farms, being $867 for nurseries, $541 for florists' establishments, $96 for dairy farms, $92 for vegetable farms, $75 for fruit farms, $60 for hay and grain farms, $44 for live-stock farms, $35 for tobacco farms, and $28 for sugar farms. "Managers" expended on an average $219; "cash tenants," $53; "share tenants," $49; and "owners," $47. White farmers expended $53 per farm, and colored farmers, $23.

Fertilizers purchased in 1899 cost $2,695,470, an average of $10 per farm and an increase since 1889 of 68.2 per cent. The average expenditure was $32 for nurseries, $23 for florists' establishments, $15 for vegetable farms, $12 for dairy farms, $10 for live-stock farms, $9 for hay and grain farms, $8 for tobacco farms, $7 for fruit farms, and $5 for sugar farms.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 220. WASHINGTON, D. C. JULY 1, 1902.

AGRICULTURE.

KENTUCKY.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

SIR: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the state of Kentucky, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land under one management used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It includes also the house in which the farmer resides, and all other buildings used by him in connection with his farming operations.

The farms of Kentucky, June 1, 1900, numbered 234,667, and were valued at $382,004,890. Of this amount, $90,887,460, or 23.8 per cent, represents the value of buildings, and $291,117,430, or 76.2 per cent, the value of land and improvements other than buildings. On the same date the value of farm implements and machinery was $15,301,860, and of live stock, $73,739,106. These values, added to that of farms, give $471,045,856, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $123,266,785, of which amount $44,303,940, or 35.9 per cent, represents the value of animal products, and $78,962,845, or 64.1 per cent, the value of crops, including forest products cut or produced on farms. The total value of farm products for 1899 exceeds that for 1889 by $57,318,300, or 86.9 per cent, but a part of this increase is doubtless due to a more detailed enumeration in 1900 than in 1890.

The "gross farm income" is obtained by deducting from the total value of farm products the value of the products fed to live stock on the farms of the producers. In 1899 the reported value of products fed was $21,128,530, leaving $102,138,255 as the gross farm income. The ratio which the latter amount bears to the "total value of farm property" is referred to in this bulletin as the "percentage of gross income upon investment." For Kentucky in 1899 it was 21.7 per cent.

As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

The statistics presented in this bulletin will be treated in greater detail in the report on agriculture in the United States. The present publication is designed to present a summarized advance statement for Kentucky.

Very respectfully,

L. G. Powers.
Chief Statistician for Agriculture.

KENTUCKY.

GENERAL STATISTICS.

Kentucky has a total land surface of 40,000 square miles, or 25,600,000 acres, of which 21,979,422 acres, or 85.9 per cent, are included in farms.

The surface is an elevated plateau sloping from the Appalachian Mountains in the southeast to the Ohio and Mississippi rivers on the north and west. In the western part the surface is generally level, and low in altitude, while some of the mountains in the east attain a height of 2,500 feet above sea level. The Tennessee, Cumberland, Green, Kentucky, and Licking rivers flow into the Ohio and form a succession of river valleys across the State.

The soil is generally favorable for cultivation. In the north central part is situated the blue grass region, renowned for its fertile lands, rich pastures, and superior grades of horses and cattle. Here the soil is enriched by disintegrating limestone of such great depth as to insure almost perpetual fertility. The productive alluvial soil of the river valleys is fertilized by frequent inundations. Corn, tobacco, wheat, and hay are the leading products. Nearly all the hemp produced in the United States is grown in Kentucky. Vegetables and orchard fruits are grown in large quantities in the region along the Ohio River between the cities of Louisville and Cincinnati, which furnish good markets for the products of the state.

NUMBER AND SIZE OF FARMS.

The following table gives, by decades since 1850, the number of farms, the total and average acreage, and the per cent of farm land improved.

TABLE 1.—FARMS AND FARM ACREAGE: 1850 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	234,667	21,979,422	13,741,968	8,237,454	93.7	62.5
1890	179,264	21,412,229	11,818,882	9,593,347	119.4	55.2
1880	166,453	21,495,240	10,731,683	10,763,557	129.1	49.9
1870	118,422	18,660,106	8,103,850	10,556,256	157.6	43.4
1860	90,814	19,163,261	7,644,208	11,519,053	211.0	39.9
1850	74,777	16,949,748	5,968,270	10,981,478	226.7	35.2

The number of farms reported June 1, 1900, was more than three times the number reported in 1850, and 30.9 per cent greater than in 1890. The total acreage of farm land shows alternating increases and decreases through the five decades. For the last decade, a gain of 2.6 per cent is shown. The fact that the number of farms has increased more rapidly than the total acreage indicates a progressive division of farm holdings, and a decrease in the average size of farms. The steady increase in the acreage and per cent of improved farm land is in keeping with this movement.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1850.

TABLE 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND OF FARM PRODUCTS: 1850 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$471,045,856	$382,004,890	$15,301,860	$73,739,106	$123,266,785
1890	428,170,266	346,339,360	10,906,506	70,924,400	65,948,485
1880	358,703,832	299,298,631	9,734,634	49,670,567	63,850,155
1870[2]	386,099,155	311,238,916	8,572,896	66,287,343	[3]87,477,374
1860	360,839,765	291,496,955	7,474,573	61,868,237	....
1850	189,851,735	155,021,262	5,169,037	29,661,436	....

[1] For year preceding that designated.
[2] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other years they must be diminished one-fifth.
[3] Includes betterments and additions to live stock.

The gain in the last decade in the total value of farm property was $42,875,590, or 10.0 per cent. The increase in the value of land, improvements, and buildings was $35,665,530, or 10.3 per cent; in that of implements and machinery, $4,395,354, or 40.3 per cent; and in that of live stock, $2,814,706, or 4.0 per cent. The value of the farm products of 1899 was 86.9 per cent greater than that reported for 1889. A portion of this increase, and of that shown for implements and machinery, is doubtless the result of a more detailed enumeration in 1900 than in previous census years.

COUNTY STATISTICS.

Table 3 gives a statement of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS, AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH VALUE OF PRODUCTS OF 1899 NOT FED TO LIVE STOCK, AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Value of products not fed to live stock.	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.
The State	234,667	226,408	21,979,422	13,741,968	$291,117,430	$90,887,460	$15,301,860	$73,739,106	$102,138,255	$6,613,330	$908,250
Adair	2,422	2,349	225,257	124,365	1,214,900	454,950	93,540	496,380	498,088	19,190	10,580
Allen	2,345	2,265	199,540	120,341	1,062,970	396,630	104,710	551,600	713,637	29,130	10,050
Anderson	1,255	1,224	116,658	97,378	1,443,120	658,440	101,730	461,380	528,023	29,480	390
Ballard	1,440	1,391	130,497	84,401	1,636,070	476,880	142,160	509,854	728,825	50,620	1,480
Barren	3,321	3,231	285,706	214,010	2,490,340	1,072,080	185,720	888,139	1,302,458	48,330	12,190
Bath	2,027	1,917	151,266	124,200	3,224,790	794,560	104,670	741,418	996,300	53,760	1,610
Bell	1,420	1,351	143,288	41,074	706,970	234,160	26,340	243,613	325,770	9,640	430
Boone	1,698	1,540	149,191	137,304	4,416,450	1,673,210	187,620	838,759	1,110,368	77,910	9,260
Bourbon	1,348	1,274	174,383	155,849	10,481,060	2,154,820	233,740	1,824,275	1,947,600	242,530	900
Boyd	708	637	65,111	44,741	627,260	222,460	43,830	231,741	261,999	13,400	1,130
Boyle	875	851	108,831	80,138	3,661,240	1,039,650	130,120	713,727	708,916	65,320	1,630
Bracken	1,711	1,661	126,953	112,255	2,902,320	1,042,090	139,560	471,936	1,033,680	34,600	2,860

The number of farms increased in nearly all counties in the last decade, Bracken and Kenton alone reporting decreases. Nearly three-fourths of the counties report an increase in the total area of farm land since 1890. The decreases are mainly in the eastern half of the state. The smaller area of improved land reported in several of the counties is due to a more intensive cultivation of the soil, and to the use of a more strict construction of the term "improved" by the Twelfth than by any preceding census. The average size of farms is smallest in the northeastern counties, where tobacco and corn occupy a large area, and largest in the counties raising live stock. The average size for the state is 93.7 acres, and in the majority of counties the farms do not vary greatly from this average.

In a number of instances the counties whose farm areas decreased also report a decrease in the value of farms. The average value for the state is $1,627.86. Four counties, Campbell, Morgan, Owsley, and Todd, report a decrease in the value of implements and machinery, the majority of the others showing extensive increases. The value of live stock increased in more than two-thirds of the counties.

The expenditure for labor in 1899 averaged $28.18 per farm, and varied greatly in the different counties. For fertilizers, the total expenditure was nearly three times as great in 1899 as in 1889. The average per farm in 1899 was $3.87. Decreases are reported by two counties only, Bullitt and Robertson.

FARM TENURE.

Table 4 gives a comparative statement of farm tenure in 1880, 1890, and 1900. Tenants are divided into two groups: "Cash tenants," who pay a rental in cash or in a stated amount of labor or farm produce, and "share tenants," who pay as rental a stated share of the products.

In Table 5 the tenure of farms for 1900 is given by race of farmer, and "farms operated by owners" are subdivided into groups, designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it, and the other or others owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive a fixed salary from the owners for their supervision ana other services.

Table 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 TO 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.
1900	234,667	157,602	16,776	60,289	67.2	7.1	25.7
1890	179,264	134,529	14,524	30,211	75.1	8.1	16.8
1880	166,453	122,426	16,824	27,203	73.6	10.1	16.3

[1] Including "part owners," "owners and tenants," and "managers."

Table 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

Part 1.—NUMBER OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	234,667	137,557	14,659	3,780	1,606	16,776	60,289
White	223,429	133,317	13,679	3,698	1,543	15,987	55,305
Colored[1]	11,238	4,240	1,080	82	63	789	4,984

Part 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

The State	100.0	68.6	6.2	1.6	0.7	7.2	25.7
White	100.0	59.7	6.1	1.6	0.7	7.2	24.7
Colored[1]	100.0	37.7	9.6	0.7	0.6	7.0	44.4

[1] Comprising 11 Indians and 11,227 negroes.

Since 1880 the total number of farms has increased 68,214; the number operated by owners, 35,176; and by tenants, 33,038. From 1890 to 1900 the total number of farms increased 55,403, or 30.9 per cent; that of owners 23,073, or 17.2 per cent; and that of tenants 32,330, or 72.3 per cent. The number of share tenants in 1900 is approximately twice that reported for 1890, but the number of cash tenants shows but a slight increase in the last decade, and is less for 1900 than for 1880.

Of the total number of farms in the state in 1900, 25.7 per cent were operated by share tenants. This percentage is an increase of 8.9 since 1890, while the percentages for owners and cash tenants show corresponding decreases.

Of the farms in Kentucky, 95.2 per cent are operated by white farmers and 4.8 per cent by colored farmers. Of the white farmers, 67.4 per cent own all or part of the farms they operate and 32.6 per cent operate farms owned by others. For colored farmers, the corresponding percentages are 48.1 and 51.9.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the number conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

Table 6.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	234,667	93.7	21,979,422	100.0	$471,045,856	100.0

Share tenants	60,289	49.0	2,953,264	13.4	66,934,162	14.2

[1] Comprising 11 Indians and 11,227 negroes.

Table 7.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY RACE OF FARMER AND BY TENURE.

RACE OF FARMER, AND TENURE.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$1,241	$387	$65	$314	$435	21.7
White farmers	1,270	399	67	323	444	21.5
Colored farmers[1]	644	153	32	146	270	27.7
Owners	1,301	451	74	358	458	21.0
Part owners	1,650	462	87	384	555	21.5
Owners and tenants	1,649	575	103	454	608	21.9
Managers	4,797	1,325	174	1,459	1,048	13.5
Cash tenants	1,750	411	71	322	492	19.3
Share tenants	741	180	32	157	310	28.0

[1] Comprising 11 Indians and 11,227 negroes.

White farmers cultivate 98.0 per cent of the farm area and their property represents 97.7 per cent of the total value. For colored farmers the corresponding percentages are 2.0 and 2.3, respectively.

As shown in Table 6, the average number of acres per farm is largest for the farms of "managers." The average value per acre, and the average value per farm under Table 7, are highest for the same group. The lowest average values per farm are shown for tenant-operated farms. The relatively high per cent of gross income shown for farms operated by share tenants and for those operated by negroes must not be construed as evidence of superior farm management. This condition is the result of a system of tenure whereby many estates formerly cultivated by hired labor are now divided into small tracts which are leased and reported as tenant farms. The tracts not so leased by the owners, including the main buildings but less productive land, constitute the farms as reported by such owners. The large per cent of gross income shown for colored farmers is due also to the smaller average size of their farms, and to the lower value of their farm property.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	234,667	93.7	21,979,422	100.0	$471,045,856	100.0
Under 3 acres	1,175	2.2	2,641	(1)	888,446	0.2
3 to 9 acres	14,960	6.3	94,460	0.4	6,482,363	1.4
10 to 19 acres	26,769	13.7	367,939	1.7	15,204,769	3.2
20 to 49 acres	51,850	32.0	1,658,283	7.6	52,191,359	11.1
60 to 99 acres	60,435	68.9	4,161,328	18.9	83,377,574	17.7
100 to 174 acres	48,564	125.8	6,107,837	27.8	114,537,839	24.3
175 to 259 acres	17,480	207.6	3,629,315	16.5	74,630,621	15.9
260 to 499 acres	10,406	332.3	3,458,131	15.7	76,803,655	16.3
500 to 999 acres	2,470	612.9	1,513,808	6.9	33,602,346	7.1
1,000 acres and over	558	1,766.5	985,680	4.5	13,326,884	2.8

[1] Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$1,241	$387	$65	$314	$435	21.7
Under 3 acres	305	337	25	89	266	35.2
3 to 9 acres	201	148	16	68	127	29.3
10 to 19 acres	309	139	20	100	185	32.6
20 to 49 acres	623	194	35	155	269	26.8
50 to 99 acres	811	280	55	234	356	25.8
100 to 174 acres	1,405	489	86	378	525	22.3
175 to 259 acres	2,700	798	132	639	815	19.1
260 to 499 acres	4,829	1,276	194	1,082	1,238	16.8
500 to 999 acres	9,233	2,031	279	2,061	2,082	15.3
1,000 acres and over	17,308	2,857	325	3,393	3,027	12.7

Of the total number of farms, the group containing farms of 50 to 99 acres each comprises 25.8 per cent. The sixth group, or that of medium-sized farms, containing from 100 to 174 acres each, represents approximately one-fourth of both the total farm acreage and the total value of farm property.

For the two groups of farms containing less than 10 acres each, the average values given in table 9 are relatively high, as these groups contain most of the florists' establishments and a number of city dairies. The income from these industries is determined not so much by the acreage of land used as by the amount of capital invested in buildings and implements, and by the amounts expended for labor and fertilizers.

The average gross incomes per acre for the various groups classified by area are as follows: Farms under 3 acres, $118.46; 3 to 9 acres, $20.09; 10 to 19 acres, $13.45; 20 to 49 acres, $8.42; 50 to 99 acres, $5.17; 100 to 174 acres, $4.18; 175 to 259 acres, $3.93; 260 to 499 acres, $3.71; 500 to 999 acres, $3.40; 1,000 acres and over, $1.71.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading features of the statistics relating to farms classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop and constitutes at least 40 per cent of the total value of products not fed to live stock, the farm is classified as a "hay and grain" farm. If vegetables are the leading crop, constituting 40 per cent of the value of such products, it is a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive 40 per cent of their income from any one class of products. Farms with no income in 1899 are classified according to the agricultural operations upon other farms in the same locality.

TABLE 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	234,667	93.7	21,979,422	100.0	$471,045,856	100.0
Hay and grain	53,397	94.7	5,056,310	23.0	115,255,486	24.5
Vegetables	4,319	39.9	172,186	0.8	10,497,678	2.2
Fruits	1,918	84.7	162,534	0.7	3,630,907	0.8
Live stock	78,547	108.0	8,481,529	38.6	174,147,432	37.0
Dairy produce	2,443	87.4	213,402	1.0	10,726,118	2.3
Tobacco	35,406	72.9	2,581,938	11.7	78,911,706	16.7
Cotton	162	107.8	17,465	0.1	469,726	0.1
Sugar	72	65.0	4,679	(1)	100,626	(1)
Flowers and plants	77	4.8	366	(1)	537,731	0.1
Nursery products	26	120.3	3,128	(1)	207,427	(1)
Miscellaneous	58,300	90.7	5,285,885	24.1	76,561,019	16.3

[1] Less than one-tenth of 1 per cent.

TABLE 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$1,241	$387	$65	$314	$435	21.7
Hay and grain	1,442	385	69	262	415	19.2
Vegetables	1,686	613	77	155	384	15.8
Fruits	1,141	461	82	209	480	25.3
Live stock	1,277	430	70	440	442	20.0
Dairy produce	2,760	953	129	549	829	18.9
Tobacco	1,446	430	70	283	594	26.7
Cotton	1,961	487	105	347	784	27.0
Sugar	908	275	56	159	268	19.2
Flowers and plants	3,410	3,314	214	46	2,825	40.5
Nursery products	5,810	1,759	270	139	4,288	53.8
Miscellaneous	782	266	48	217	327	24.9

For the several classes of farms the average values per acre of products not fed to live stock are as follows: For farms deriving their principal income from flowers and plants, $594.37; nursery products, $35.65; vegetables, $9.63; dairy produce, $9.49; tobacco, $8.15; cotton, $7.27; fruits, $5.66; hay and grain, $4.38; sugar, $4.12; live stock, $4.10; and miscellaneous products, $3.61.

The wide variations shown in the averages and in the percentages of gross income are largely due to the fact that in computing gross income no deduction is made for expenditures. For florists' establishments, nurseries, and market gardens the average expenditure for such items as labor and fertilizers represents a far larger percentage of the gross income than in the case of "hay and grain," "live-stock," or "miscellaneous" farms. Were it possible to present the average net income, the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by the reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.

$1 to $49	210	70	10	53	28	8.2
$50 to $99	251	92	13	83	70	16.1
$100 to $249	400	147	25	146	166	23.2
$250 to $499	793	286	54	270	348	24.8
$500 to $999	1,802	604	109	446	680	22.1
$1,000 to $2,499	4,791	1,368	218	914	1,444	19.8
$2,500 and over	15,052	3,543	491	2,966	4,305	19.5

The absence of income in the first group is due in part to the fact that the enumerators could not always secure complete reports for farms where changes in ownership or tenancy had occurred shortly prior to the date of enumeration. Frequently the persons in charge of such farms on June 1, 1900, could not give definite information concerning the products of the preceding year. The same statement is true, also, of some of the farms with reported incomes of less than $100. To this extent the reports fall short of giving a complete exhibit of farm income in 1899. Other farms with small reported incomes are doubtless the suburban or summer homes of city merchants and professional men, who derive their principal incomes from other than agricultural pursuits.

LIVE STOCK.

At the request of the various live-stock associations of the country a new classification of domestic animals was adopted for the Twelfth Census. The age grouping for neat cattle was determined in accordance with their present and prospective relations to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits a very close comparison with the figures published in previous census reports.

Table 14 presents a summary of live-stock statistics.

TABLE 14.—DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age in years.	ON FARMS.			NOT ON FARMS.
		Number.	Value.	Average value.	Number.
Calves	Under 1	250,502	$2,480,227	$9.90	6,497
Steers	1 and under 2	141,943	2,851,193	20.09	945
Steers	2 and under 3	107,655	3,326,702	30.90	2,599
Steers	3 and over	49,580	2,140,220	43.17	1,378
Bulls	1 and over	12,937	431,512	33.35	130
Heifers	1 and under 2	104,861	1,880,432	17.93	1,045
Cows kept for milk	2 and over	364,025	10,518,031	28.89	23,583
Cows and heifers not kept for milk.	2 and over	51,745	1,359,424	26.27	314
Colts	Under 1	26,487	1,062,057	40.10	576
Horses	1 and under 2	24,927	1,428,700	57.32	611
Horses	2 and over	400,283	22,057,785	55.11	44,361
Mule colts	Under 1	20,710	600,746	29.01	191
Mules	1 and under 2	20,945	933,563	44.57	207
Mules	2 and over	149,010	9,571,244	64.23	7,047
Asses and burros	All ages	5,259	459,210	87.32	379
Lambs	Under 1	581,185	1,779,651	3.06	993
Sheep (ewes)	1 and over	647,838	2,172,170	3.35	2,018
Sheep (rams and wethers).	1 and over	68,320	239,384	3.50	478
Swine	All ages	1,954,537	5,176,183	2.65	54,452
Goats	All ages	11,967	19,753	1.65	636
Fowls:[1]					
Chickens[2]		6,849,079	2,723,221		
Turkeys		279,749			
Geese		541,576			
Ducks		185,064			
Bees (swarms of)		203,820	527,098	2.59	
Unclassified			600		
Value of all live stock.			73,739,106		

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.
[2] Including guinea fowls.

The value of live stock on farms, June 1, 1900, was $73,739,106. Of this amount 33.3 per cent represents the value of horses; 19.6 per cent, that of neat cattle other than dairy cows; 15.0 per cent, that of mules; 14.3 per cent, that of dairy cows; 7.0 per cent, that of swine; 5.7 per cent, that of sheep; 3.7 per cent, that of poultry; and 1.4 per cent, that of all other live stock.

The average prices of all young horses are high, and prices of horses 1 and under 2 years old are higher than of horses over 2 years old. This is due to the fact that Kentucky contains many extensive stock farms devoted exclusively to the breeding and training of fine horses.

No reports were secured of the value of live stock not on farms, but it is probable that such animals have higher average values than those on farms. Allowing the same averages, the value of live stock not on farms, exclusive of poultry and bees, June 1, 1900, was $4,095,901, and the total value of live stock in the state was approximately $77,835,007.

CHANGES IN LIVE STOCK ON FARMS.

The following table shows the changes since 1850 in the number of the most important domestic animals.

TABLE 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS: 1850 TO 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	364,025	719,223	451,697	195,924	716,158	1,954,537
1890	364,516	701,575	401,356	151,649	937,124	2,036,746
1880	301,882	541,912	372,648	116,153	1,000,269	2,225,225
1870	247,615	452,712	317,034	99,230	936,765	1,838,227
1860	269,215	566,844	355,704	117,634	938,990	2,330,595
1850	247,475	505,037	315,682	65,609	1,102,091	2,891,163

[1] Lambs not included.

Many fluctuations in the numbers of the different classes of live stock are shown, but, with the exception of the decade including the Civil War period, the numbers of all neat cattle, horses, and mules show quite regular increases throughout the half century. Since 1880 the numbers of sheep and swine have decreased.

For the decade following 1890 the number of dairy cows shows a decrease of 0.1 per cent, probably due to the close restriction of the term "dairy cows" by the census of 1900 to "cows kept for milk" exclusively, while many cows which were milked at some time in the year, but were dry at the time of enumeration, were classed with "cows and heifers not kept for milk," and consequently with "other neat cattle." The numbers of sheep and swine show decreases in the last decade of

23.6 per cent and 4.0 per cent, respectively. The following increases in numbers were shown for the same period: Mules and asses, 29.2 per cent; horses, 12.5 per cent; and neat cattle other than dairy cows, 2.5 per cent.

In 1900 the enumerators were instructed to report no fowls under three months old, which limitation was not made in previous census reports. This fact partially accounts for the decrease in numbers of all classes of domestic fowls in the decade 1890 to 1900. The decreases in numbers of fowls for that period are as follows: Turkeys, 58.4 per cent; ducks, 50.0 per cent; chickens, 46.2 per cent; and geese, 44.0 per cent.

ANIMAL PRODUCTS.

Table 16 is a summarized exhibit of the animal products of 1899.

Table 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS, IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	3,617,497	$737,632
Mohair and goat hair	Pounds	524	163
Milk	Gallons	[1] 159,311,527	[2] 9,985,540
Butter	Pounds	30,446,381	
Cheese	Pounds	45,759	
Eggs	Dozens	35,337,340	3,460,607
Poultry			4,970,063
Honey	Pounds	2,681,720	291,179
Wax	Pounds	53,120	
Animals sold			16,660,676
Animals slaughtered			8,198,080
Total			44,303,940

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of milk sold or consumed, and of butter and cheese made.

The value of the animal products of the state for 1899 was $44,303,940, or about 60 per cent as great as the value of all live stock on farms, June 1, 1900. Of this amount, 56.1 per cent represents the value of animals sold and animals slaughtered; 22.5 per cent, that of dairy products; 19.0 per cent, that of poultry and eggs; 1.7 per cent, that of wool; and 0.7 per cent, that of honey and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

The value of animals sold and animals slaughtered on farms in 1899 was $24,858,756, or 20.2 per cent of the total value of farm products. Of all farmers in the state reporting live stock, 183,341, or 81.9 per cent, report animals slaughtered, the average value per farm being $44.71. Sales were reported by 122,784 farmers, or 54.9 per cent of all reporting live stock. The average receipts per farm were $135.69. Fayette, Bourbon, and Shelby counties each reported more than $500,000 received from the sale of live animals, the average receipts per farm for Fayette county being $1,169.11. In obtaining these reports the enumerators were instructed to secure from each farm operator a statement of the amount received from sales in 1899, less the amount paid for animals purchased during the same year.

DAIRY PRODUCE.

In 1899, 2,443 farms, or 1.0 per cent of all in the state, received their principal income from the sale of dairy produce. There was an increase of 40,814,238 gallons, or 34.4 per cent, in the production of milk, an increase of 4.8 per cent in amount of butter made on farms, and a decrease of 29.4 per cent in amount of cheese made on farms in the decade 1890 to 1900.

Of the $9,985,540 given in Table 16 as the value of dairy products, $7,691,040, or 77.0 per cent, represents the value of dairy products consumed on farms, and $2,294,500, or 23.0 per cent, the receipts from sales. Of the latter amount, $1,291,641 was received from the sale of 8,923,259 gallons of milk; $953,370, from 5,873,883 pounds of butter; $45,766, from 95,671 gallons of cream; and $3,723, from 37,245 pounds of cheese.

POULTRY, EGGS, WOOL, AND HONEY AND WAX.

Of the $8,430,670 given as the value of poultry and eggs, 59.0 per cent represents the value of poultry raised, and 41.0 per cent that of eggs produced. The production of eggs in 1899 was 10,645,903 dozens greater than in 1889, a gain of 43.1 per cent.

Compared with the production of wool for 1889, that of 1899 shows an increase of 839,964 pounds, or 30.2 per cent. This increase is more apparent than real, owing to the fact that the fleeces of at least 273,757 sheep were omitted from the tables in 1890, but included in a general estimate of wool shorn after the census enumeration. Bourbon, Boone, Clarke, Scott, Mercer, and Harrison counties lead in the production of wool, ranking in the order named and each reporting more than 100,000 pounds as the product of 1899.

The production of apiarian products in 1899 compared with that in 1889 shows an increase of 16.1 per cent in amount of honey, and 42.7 per cent in amount of wax. The counties leading were Pendleton, Pike, Pulaski, and Madison.

HORSES AND COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents for the leading groups of farms the number of farms reporting horses and dairy cows, the total number of these animals, and the average number per farm. In computing the averages presented, only those farms which report the kind of stock under consideration are included.

TABLE 17.—HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.			DAIRY COWS.		
	Farms reporting.	Number.	Average per farm.	Farms reporting.	Number.	Average per farm
Total	181,179	451,697	2.5	189,905	364,025	1.9
White farmers	174,162	438,815	2.5	183,796	355,845	1.9

Miscellaneous[2]	43,389	87,647	2.0	49,952	81,468	1.6

[1] Including "part owners" and "owners and tenants."
[2] Including florists' establishments and nurseries, and cotton and sugar farms.

CROPS.

The following table presents the statistics of the principal crops of 1899.

TABLE 18.—ACREAGES, QUANTITIES, AND VALUES OF THE PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantity.	Value.
Corn	3,319,257	Bushels	73,974,220	$29,423,996
Wheat	1,431,027	Bushels	14,264,500	8,923,760
Oats	316,590	Bushels	4,009,830	1,247,928
Barley	953	Bushels	17,772	8,157
Rye	17,618	Bushels	155,365	88,315
Buckwheat	84	Bushels	879	615
Broom corn	839	Pounds	384,550	18,209
Flaxseed	3	Bushels	10	10
Clover seed		Bushels	7,707	30,933
Grass seed		Bushels	270,973	167,860
Hay and forage	683,139	Tons	776,534	6,100,647
Cotton seed		Tons	[1]660	5,940
Cotton	2,396	Bales	1,369	52,812
Tobacco	384,805	Pounds	314,288,050	18,541,982
Hemp	14,107	Pounds	10,303,560	468,464
Hops	4	Pounds	1,668	113
Peanuts	92	Bushels	1,405	1,353
Dry beans	5,633	Bushels	49,106	57,672
Dry pease	8,394	Bushels	83,089	90,739
Potatoes	37,160	Bushels	2,661,774	1,260,100
Sweet potatoes	14,178	Bushels	925,786	507,038
Onions	1,705	Bushels	305,113	237,694
Miscellaneous vegetables	81,929			4,181,122
Maple sugar		Pounds	2,340	291
Maple sirup		Gallons	2,367	2,450
Sorghum cane	21,982	Tons	[2]22,601	64,984
Sorghum sirup		Gallons	1,277,206	384,292
Small fruits	6,126			435,462
Grapes	[3]2,382	Centals	51,342	[4]112,350
Orchard fruits	[3]230,336			[5]1,943,645
Nuts				8,365
Forest products				4,180,085
Flowers and plants	132			262,288
Seeds	52			8,668
Nursery products	837			114,749
Willows	90			7,007
Miscellaneous	846			22,760
Total	6,582,696			78,962,845

[1] Exclusive of 13 tons, valued at $119, sold in seed cotton and included with the cotton.
[2] Sold as cane.
[3] Estimated from number of vines or trees.
[4] Including value of raisins, wine, etc.
[5] Including value of cider, vinegar, etc.

Of the total value of crops in 1899, cereals contributed 50.3 per cent; vegetables, including potatoes, sweet potatoes, and onions, 7.8 per cent; hay and forage, 7.7 per cent; forest products, 5.3 per cent; fruits, 3.2 per cent; flowers and plants, 0.3 per cent; and all other products, 25.4 per cent.

The average values per acre of crops were: Flowers and plants, $1,987.03; onions, $139.41; nursery products, $137.10; small fruits, $71.08; miscellaneous vegetables, $51.03; tobacco, $48.18; potatoes, $33.91; hay and forage, $8.93; orchard fruits, $8.44; and cereals, $7.81. The crops yielding the greatest returns were grown upon the most highly cultivated land, and required relatively large expenditures for labor and fertilizers.

CEREALS.

The following table is an exhibit of the cereal production since 1849.

TABLE 19.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899.

PART 1.—ACREAGE.

YEAR.[1]	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	953	84	3,319,257	316,590	17,618	1,431,027
1889	5,776	384	2,960,382	645,316	45,546	898,694
1879	20,089	1,024	3,021,176	403,416	89,417	1,160,108
PART 2.—BUSHELS PRODUCED.						
1899	17,772	879	73,974,220	4,009,830	155,365	14,264,500
1889	165,959	3,804	78,434,847	8,775,814	423,847	10,707,462
1879	486,326	9,942	72,852,263	4,580,738	668,050	11,356,113
1869	238,486	3,443	50,091,006	6,620,103	1,108,933	5,728,704
1859	270,685	18,928	64,043,633	4,617,029	1,055,260	7,394,809
1849	95,343	16,097	58,672,591	8,201,311	415,073	2,142,822

[1] No statistics of acreage were secured prior to 1879.

The total area devoted to cereals in 1879 was 4,695,230 acres; in 1889, 4,556,098 acres; and in 1899, 5,085,529 acres, an increase in twenty years of 8.3 per cent. The increases in area under cereals in the decade from 1889 to 1899 were: Wheat, 59.2 per cent, and corn, 12.1 per cent. The decreases were: Oats, 50.9 per cent; rye, 61.3 per cent; barley, 83.5 per cent; and buckwheat, 78.1 per cent. The total number of bushels produced in 1849 was 69,543,237, and in 1899, 92,422,566, showing an increase of 32.9 per cent in fifty years.

Of the total area devoted to cereals in 1899, 65.3 per cent was devoted to corn; 28.1 per cent to wheat; 6.2 per cent to oats; 0.4 per cent to rye, barley, and buckwheat.

Corn is raised in all parts of the state. The four counties of Christian, Union, Hardin, and Logan, in the Ohio and Cumberland river valleys, report 13.7 per cent of all the area under wheat, while the largest acreage in oats is reported from the central counties, Barren, Warren, Pulaski, and Grayson, furnish 17.0 per cent of the total area. Barley and buckwheat receive little attention.

HAY AND FORAGE.

In 1900, 86,575 farmers, or 36.9 per cent of the total number, reported hay and forage crops. Exclusive of cornstalks and corn strippings, they obtained an average yield of 0.96 ton per acre. The total area in hay and forage in 1899 was 683,139 acres, or 3.2 per cent greater than ten years before.

The acreages and yields of the various kinds of hay and forage in 1899 were as follows: Wild, salt, and prairie grasses, 6,375 acres and 5,550 tons; millet and Hungarian grasses, 37,653 acres and 37,139 tons; alfalfa, or lucern, 808 acres and 1,056 tons; clover, 158,110 acres and 159,747 tons; other tame and cultivated grasses, 403,211 acres and 370,461 tons; grains cut green for hay, 55,334 acres and 56,911 tons; crops grown for forage, 21,648 acres and 24,202 tons; and cornstalks and corn strippings, 172,809 acres and 121,468 tons.

In Table 18 the production of cornstalks and corn strippings is included under "hay and forage," but the acreage is included under "corn," as the forage secured was only an incidental product of the corn crop.

SORGHUM CANE.

The present census shows that in 1899 sorghum cane was grown by 33,692 farmers on 21,982 acres, an average of 0.65 acre for each farm reporting. From this area they sold 22,601 tons of cane for $64,984, and from the remaining product manufactured 1,277,206 gallons of sirup, valued at $384,292. There was a decrease in acreage from 1889 of 41.0 per cent. The total value of sorghum-cane products was $449,276, an average of $13.33 for each farm reporting, and of $20.44 per acre. The average yield of sirup per acre was 58.1 gallons, not including the product of the cane sold, compared with 56.3 gallons in 1889. The average value per gallon was 30.1 cents.

HEMP.

Hemp was grown in 1899 by 937 farmers on 14,107 acres, from which they produced 10,303,560 pounds, a decrease since 1889 of 39.9 per cent in acreage and of 52.3 per cent in production. The largest crop ever reported was in 1859, when there was a production of 78,818,000 pounds. Since that time there has been a great falling off in the crop.

The total value of the crop in 1899 was $468,454, an average of $499.95 for each farm reporting, and of $33.21 per acre. The average yield per acre was 730.4 pounds, compared with 919.9 pounds in 1889.

The crop is confined to 17 counties of the state, the 5 leading counties being Fayette, with 4,297 acres; Jessamine, with 2,117 acres; Woodford, with 2,065 acres; Garrard, with 1,412 acres; and Clark, with 1,130 acres. These 5 counties furnished 78.1 per cent of the acreage and 78.1 per cent of the entire production.

COTTON.

The following table is a statement of the changes in cotton production since 1879.

TABLE 20.—ACREAGE AND PRODUCTION OF COTTON: 1879 TO 1899.

YEAR.	ACREAGE.		PRODUCTION.		
	Total.	Per cent of increase.	Commercial bales.	Pounds.	Per cent of increase.
1899	2,396	[1]8.9	1,369	685,724	64.7
1889	2,629	[1]1.4	873	416,421	[1]32.8
1879	2,667	....	1,367	619,251	....

[1] Decrease.

The total area under cotton in Kentucky in 1879, was 2,667 acres, which was the largest area reported for this crop by any census. This land produced 619,251 pounds of cotton. The census of 1890 showed a decrease in the production of cotton of 202,830 pounds, or 32.8 per cent.

In 1899, 190 farmers seeded to cotton an area of 2,396 acres, an average of 12.6 acres per farm reporting. From this land was produced 685,724 pounds of cotton, an average of 3,609 pounds per farm and 286 pounds per acre. The total value of this product, including the value of both lint and seed, was $58,752, an average of $309.22 per farm and $24.52 per acre.

The limited area devoted to cotton in 1899 was divided among 25 counties, of which Fulton county, located in the extreme southwestern corner of the state, reported all but 72 acres, or 97.0 per cent of the total acreage.

TOBACCO.

The present census shows that in 1899 tobacco was grown by 86,534 farmers, who reported 384,805 acres, and a yield of 314,288,050 pounds. This shows a gain in ten years of 40.1 per cent in acreage and 41.6 per cent in production, and is the largest acreage and production ever reported. The next largest was in 1889, when 274,587 acres yielded 221,880,303 pounds.

The average yield per acre in 1889 was 808.1 pounds, while in 1899 it was 816.7 pounds. The total value of the crop in the latter year was $18,541,982, an average of $214.27 for each farm reporting, and of $48.19 per acre. The average value per pound was 5.9 cents.

The crop was grown in 119 counties, Christian county leading, with 23,402 acres; Daviess county was next in rank, with 21,376 acres.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 may be seen in the following table.

TABLE 21.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900	1890	1899	1889
Apples	8,757,238	5,730,144	6,053,717	10,679,389
Apricots	5,417	3,417	392	1,621
Cherries	237,612	131,089	34,258	43,393
Peaches	2,884,193	1,205,866	34,700	846,138
Pears	322,201	116,311	76,940	118,850
Plums and prunes	375,716	162,825	76,574	56,914

In 1890 the total number of fruit trees in the state was 7,349,652; in 1900 there were 12,617,897 trees, an increase of 5,268,245, or 71.7 per cent. The increases were as follows: Apple trees, 52.8 per cent; apricot trees, 58.5 per cent; cherry trees, 81.3 per cent; peach trees, 139.2 per cent; pear trees, 177.0 per cent; plum and prune trees, 130.7 per cent. The increases were general throughout the state.

Of all trees reported in 1900, 69.4 per cent were apple trees; 22.9 per cent, peach trees; 3.0 per cent, plum and prune trees; 2.5 per cent, pear trees; 2.2 per cent, cherry, apricot, and unclassified fruit trees. The latter class, which is not included in Table 20, numbered 35,520, and yielded 9,593 bushels of fruit.

The value of orchard fruits, given in Table 18, includes the value of 20,305 barrels of cider, 8,277 barrels of vinegar, and 1,581,430 pounds of dried and evaporated fruits. The quantity of fruit produced in any given year is largely determined by the nature of the season. Comparisons between the crop of 1889 and that of 1899 have little significance, because in the latter year there was an almost complete failure of peaches and apricots, and a very small yield of other fruits.

The counties bordering on the Ohio River, especially those in the western part of the state, rank highest in numbers and variety of fruit trees. Apples and peaches, however, are extensively cultivated throughout the state. The 5 counties of Meade, Breckinridge, Hardin, Jefferson, and Pulaski, ranking in the order named, reported the largest numbers of apple trees; and Trimble, Bullitt, Hardin, Jefferson, and Campbell counties, all bordering on the Ohio River, reported 37.0 per cent of the total number of peach trees.

SMALL FRUITS.

The total area used in the cultivation of small fruits in 1899 was 6,126 acres, distributed among 12,254 farms, an average of 0.5 acre per farm. Of the total area 4,128 acres were devoted to strawberries, yielding 6,767,300 quarts. Campbell and Jefferson counties reported 39.6 per cent of the acreage devoted to this crop. The acreages and productions of the other berries were as follows: Blackberries and dewberries, 1,024 acres and 1,068,340 quarts; raspberries and Logan berries, 755 acres and 787,820 quarts; gooseberries, 99 acres and 114,590 quarts; currants, 15 acres and 19,370 quarts; and other small fruits, 105 acres and 105,140 quarts.

VEGETABLES.

The total area used in the cultivation of vegetables, including potatoes, sweet potatoes, and onions, in 1899, was 134,972 acres. Of this amount 60.7 per cent was devoted to miscellaneous vegetables, 27.5 per cent to potatoes, 10.5 per cent to sweet potatoes, and 1.3 per cent to onions. Potatoes were raised throughout the state, and the 37,160 acres occupied by them yielded 2,661,774 bushels, an average of 71.6 bushels per acre.

The total area devoted to miscellaneous vegetables was 81,929 acres, of which the products of 64,289 acres were not reported in detail. Of the 17,640 acres concerning which detailed reports were received, 5,307 acres were devoted to watermelons; 3,914 to tomatoes; 3,732 to cabbages; 1,705 to sweet corn; 1,263 to muskmelons; 540 to cucumbers; 381 to beans; 364 to pease; and 434 to other vegetables.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 128 acres, and the value of the products sold therefrom was $262,288. These flowers and plants were grown by 137 farmers and florists. Of this number 77 made commercial floriculture their principal business. They had invested in the aggregate $537,731, of which $262,532 represents the value of land and improvements other than buildings; $255,155, that of buildings; $16,490, that of implements and machinery; and $3,554, that of live stock. The value of their products in 1899 was $217,914, of which $212,944 represents the value of flowers and plants, and $4,970 that of other products. The expenditure for labor was $44,927, and for fertilizers, $2,025. The average gross value of products per farm was $2,830.

In addition to the 77 principal florists' establishments, 616 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 714,748 square feet, making, with the 623,512 square feet belonging to the florists' establishments, a total of 1,338,260 square feet.

NURSERY PRODUCTS.

The total value of nursery products sold in 1899 was $114,749, reported by the operators of 65 farms and nurseries. Of this number, 26 derived their principal income from the nursery business. They had 3,128 acres of land, valued at $151,050; buildings, valued at $45,750; implements and machinery, valued at $7,012; and live stock, valued at $3,615. Their total gross income was $112,684, of which $105,449 was derived from the sale of trees, shrubs, and vines, and $7,235 from other products. The average gross income was $4,334 for each farm reporting.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $6,613,330, an average of $28 per farm. The average was highest on the most intensively cultivated farms, being $667 for nurseries, $584 for florists' establishments, $81 for dairy farms, $76 for cotton farms, $42 for vegetable farms, $37 for fruit farms, $37 for tobacco farms, $28 for live-stock farms, and $13 for sugar farms. "Managers" expended, an average of $171; "cash tenants," $38; "owners," $30; and "share tenants," $13. White farmers expended $29 per farm, and colored farmers, $10.

Fertilizers purchased in 1899 cost $908,250, which was nearly three times the amount expended in 1889, and an average of $4 per farm. The average was $26 for florists' establishments, $15 for vegetable farms, $12 for nurseries, $5 each for cotton, fruit, and hay and grain farms, $4 for tobacco farms, $4 for live-stock farms, $3 for dairy farms, and $1 for sugar farms.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 221. WASHINGTON, D. C. July 2, 1902.

MANUFACTURES.

BOOTS AND SHOES.

Hon. William R. Merriam,
Director of the Census.

Sir: I transmit herewith, for publication in bulletin form, the statistics of the manufacture of boots and shoes, prepared under my direction by Mr. George C. Houghton, of Boston, Mass., acting as an expert special agent of the division of manufactures, of the Census Office.

The statistics are shown in 10 tables. Table 1 is a comparative summary, 1880, 1890, and 1900, with per cent of increase for each decade; Table 2 shows the capital invested in machinery, tools, and implements, value of products, and average investment required for a product valued at $100, by states, 1890 and 1900, with per cent of increase; Table 3 gives the rank of states, geographically arranged, in capital, average number of wage-earners, total wages, and value of products, 1880, 1890, and 1900; Table 4 shows materials and products classified by number of establishments, 1900; Table 5 presents the cities and towns having products of over $1,000,000 in 1900, ranked by value of products, 1890 and 1900; Table 6 gives average number of wage-earners, men, women, and children, by states, 1890 and 1900, and per cent each class is of the total wage-earners; Table 7 is a comparative summary, kinds, quantity, and value of product, 1890 and 1900, with per cent of increase; Table 8 shows the average capital required for a product valued at $100, 1880, 1890, and 1890; Table 9 is a comparative summary, by states, 1890 and 1900; and Table 10 gives the detailed statistics of the manufacture, by states, 1900.

In drafting the schedules of inquiry for the census of 1900 care was taken to preserve the basis of comparison with prior censuses. Comparison may be made safely with respect to all the items of inquiry except those relating to capital, salaried officials, clerks, etc., and their salaries, the average number of employees, and the total amount of wages paid. Live capital, that is, cash on hand, bills receivable, unsettled ledger accounts, raw materials, stock in process of manufacture, finished products on hand, and other sundries, was first called for at the census of 1890. No definite attempt was made, prior to the census of 1890, to secure a return of live capital invested.

Changes were made in the inquiries relating to employees and wages in order to eliminate defects found to exist on the form of inquiry adopted in 1890. At the census of 1890 the average number of persons employed during the entire year was called for, and also the average number employed at stated weekly rates of pay, and the average number was computed for the actual time the establishments were reported as being in operation. At the census of 1900 the greatest and least numbers of employees were reported, and also the average number employed during each month of the year. The average number of wage-earners (men, women, and children) employed during the entire year was ascertained by using 12, the number of calendar months, as a divisor into the total of the average numbers reported for each month. This difference in the method of ascertaining the average number of wage-earners during the entire year may have resulted in a variation in the number, and should be considered in making comparisons.

At the census of 1890 the number and salaries of proprietors and firm members actively engaged in the business or in supervision were reported, combined with clerks and other officials. In cases where proprietors and firm members were reported without salaries, the amount that would ordinarily be paid for similar services was estimated. At the census of 1900 only the number of proprietors and firm members actively engaged in the industry or in supervision was ascertained, and no salaries were reported for this class. It is therefore impossible to compare the number and salaries of salaried officials of any character for the two censuses.

Furthermore, the schedules for 1890 included in the wage-earning class, overseers, foremen, and superintendents (not general superintendents or managers), while the census of 1900 separates from the wage-earning class such salaried employees as general superintendents, clerks, and salesmen. It is possible and probable that this change in the form of the question has resulted in eliminating from the wage-earners, as reported by the present census, many high-salaried employees included in that group for the census of 1890.

In some instances, the number of proprietors and firm members shown in the accompanying tables falls short of the number of establishments reported. This is accounted for by the fact that no proprietors or firm members are reported for corporations or cooperative establishments. The number of salaried officials, clerks, etc., is the greatest number reported employed at any one time during the year.

The reports show a capital of $101,795,233 invested in the manufacture of boots and shoes. This sum represents the value of land, buildings, machinery, tools, and implements, and the live capital utilized, but does not include the capital stock of any of the manufacturing corporations of the state. The value of the products is returned at $261,028,580, to produce which involved an outlay of $7,757,749 for salaries of officials, clerks, etc.; $59,175,883 for wages; $10,766,402 for miscellaneous expenses, including rent, taxes, etc.; and $169,604,054 for materials used, mill supplies, freight, and fuel. It is not to be assumed, however, that the difference between the aggregate of these sums and the value of the products is in any sense indicative of the profits in the manufacture of the products during the census year. The census schedule takes no cognizance of the cost of selling manufactured articles, or of interest on capital invested, or of the mercantile losses incurred in the business, or of depreciation in plant. The value of the product given is the value as obtained or fixed at the shop or factory. This statement is necessary in order to avoid erroneous conclusions from the figures presented.

Very respectfully,

S. N. D. North

Chief Statistican for Manufactures.

BOOTS AND SHOES.

By George C. Houghton, Expert Special Agent.

Prior to the census of 1880 the factory manufacture of boots and shoes was included with that of boots and shoes, custom work and repairing, and comparative figures, therefore, are not available beyond that period. In presenting the statistics of the industry for the Twelfth Census it seems proper to state that the business for the year covered by this census is said by manufacturers to have been considerably below normal, due to a reaction following the exceptional demand of the previous year and the upward tendency of prices. Table 1 presents the leading statistics of the industry at the censuses of 1880, 1890, and 1900, with per cent of increase for each decade.

Table 1.—COMPARATIVE SUMMARY, 1880 TO 1900, WITH PER CENT OF INCREASE FOR EACH DECADE.

	DATE OF CENSUS.			PER CENT OF INCREASE.	
	1900	1890	1880	1890 to 1900	1880 to 1890
Number of establishments	1,600	2,082	1,959	[1]23.2	6.3
Capital	$101,795,233	$95,282,311	$42,994,028	6.8	121.6
Salaried officials, clerks, etc., number	7,843	[2]5,643	(3)	39.0	......
Salaries	$7,757,749	[2]$5,707,931	(3)	35.9	......
Wage-earners, average number	142,922	133,690	111,152	6.9	20.3
Total wages	$59,175,883	$60,667,145	$43,001,438	[1]2.5	41.1
Men, 16 years and over	91,215	91,406	82,547	[1]0.2	10.7
Wages	$43,301,430	$46,905,974	(3)	[1]7.7	......
Women, 16 years and over	47,186	39,849	25,122	18.4	58.6
Wages	$15,068,726	$13,393,611	(3)	12.5	......
Children, under 16 years	4,521	2,435	3,483	85.7	[1]30.1
Wages	$805,727	$367,560	(3)	119.2	......
Miscellaneous expenses	$10,766,402	$9,217,519	(4)	16.8	......
Cost of materials used	$169,604,054	$118,785,831	$102,442,442	42.8	16.0
Value of products	$261,028,580	$220,649,358	$166,050,354	18.3	32.9

[1] Decrease.
[2] Includes proprietors and firm members, with their salaries; number only reported in 1900, but not included in this table. (See Table 11.)
[3] Not reported separately.
[4] Not reported.

Table 1 shows that from 1890 to 1900 there was a decrease in the number of establishments of 482, or 23.2 per cent. This is accounted for in a measure by the fact that there were included in the reports of the Eleventh Census, to what extent it is impracticable to ascertain, a large number of establishments doing contract work. This has been a peculiar feature of the shoe manufacturing business in certain sections of New England ever since the industry assumed the proportions of the factory system. Especially has this been the case in Haverhill and Lynn, Mass., though the returns of the Twelfth Census show that the number of such establishments is growing notably less.

The work of these contract shops consists largely in stitching or fitting, working the buttonholes, or heeling the shoes for manufacturers, who are thereby relieved of the expense of fitting up one or more departments; and in rush times these shops are also taken advantage of by those manufacturers who ordinarily do the work in their own establishments. In 1890 there were reported in the city of Haverhill, Mass., 74 shops doing contract work, against 49 in 1900; Lynn, Mass., had 64 in 1890, compared with 16 in 1900; and a similar ratio, it is reasonable to assume, followed in other places where such shops were located. At the Twelfth Census there was reported a total of only 78 contract shops—73 of them located in Massachusetts, 4 in New Hampshire, and 1 in New Jersey. These 78 establishments are included in the present total of 1,600 establishments; and after deducting the same from the 1,600, as shown in Table 1, there remains 1,522 legitimate shoe-manufacturing establishments in the year 1900. Undoubtedly there was a larger number of boot and shoe factories in 1890 than in 1900. Many of the smaller establishments which existed in 1890 have discontinued operations, the tendency being to consolidate the business into larger establishments.

The apparently abnormal increase of capital from 1880 to 1890 is due in part to the fact that a return of live capital was first called for at the census of 1890.

From 1890 to 1900 the average number of wage-earners increased from 133,690 to 142,922, a gain of 9,232, or 6.9 per cent; the total wages paid decreased from $60,667,145 to $59,175,883, a loss of $1,491,262, or 2.5 per cent; and the value of products increased from $220,649,358 to $261,028,580, a gain of $40,379,222, or 18.3 per cent. The improvements in machinery have so increased the capacity of shoe factories that fewer hands are necessary in turning out a given amount of work. To a considerable extent women have taken the place of men in operating the lighter machines, while children now perform work that women were doing heretofore. As a larger portion of the work is done by these cheaper classes of workers, a reduction in the total wages paid necessarily follows. The reduction of total wages is also due to the fact that many boot and shoe manufacturers have found it more advantageous to purchase from cut-stock dealers outer soles, inner soles, taps, heels, etc., already prepared, and where formerly a considerable number of wage-earners were employed in the sole-leather department of individual establishments, in many cases but a fraction of that number are now employed. These employees were not only lost entirely to the industry, but reduced the number in a class that received above the average wages.

Statistics relating to the cost of materials used and the value of the products make it evident, notwithstanding the increased use of machinery and improvement in methods, that it is costing more to manufacture shoes now than it did ten years ago. There was an increase of 42.8 per cent in the cost of materials during the decade, while the value of the finished product shows an increase of but 18.3 per cent.

Table 2 shows the capital invested in machinery, tools, and implements, the total value of products, the value of machinery, tools, and implements required for a product of $100, by states, 1890 and 1900, with the per cent of increase for the decade.

Since the invention of the rolling machine—the first practical mechanical substitute for hand labor—there has been constant progress in the perfection of shoe machinery. The shoe factory of to-day provides a perfect system of continuous manufacture, involving, in some instances, more than 100 operations. The continued improvement of the various machines, together with the keen competition in the business, has made necessary the adoption, as soon as perfected, of the latest devices. This will be seen in the increase for 1900, over the previous census year, in the value of machinery, tools, and implements required for a product valued at $100, as shown in Table 2. The total increase for this item is $3,083,941, or 22.2 per cent for the industry. In 1900 the average amount invested in machinery, tools, and implements for a product valued at $100 was $6.50, compared with $6.29 in 1890, an increase of 3.3 per cent. This item varies greatly in the several states, being reported as high as $18.57 in California, and as low as $2.57 in Rhode Island. Massachusetts shows the largest investment in machinery, $5,750,238. The increase was but $94,200, or 1.7 per cent, while the amount invested in machinery required for a product valued at $100 shows an increase of 1 per cent. The largest percentage increase in machinery during the decade is credited to Georgia. The amount of money involved, though but $23,400, indicates an increase of more than 500 per cent over 1890. The average amount of investment in machinery for a $100 product in Georgia was $6.76, or within 35 cents of the average for the United States. Indiana also shows a large increase in machinery, the percentage being 307.5. The other states having more than doubled the value of their machinery are Vermont, showing an increase of 156.9 per cent; Minnesota, 143.5 per cent; Missouri, 108.4 per cent; and Ohio, 113.9 per cent.

While the manufacture of boots and shoes in other sections of the United States has made marked progress, New England still maintains the lead in the industry, the output for that section in 1900 representing 59.5 per cent of the total for the United States. The output of the factories of Massachusetts for 1900 was $117,115,243, or 44.9 per cent of the total for the entire country, compared with 52.7 per cent in 1890, a decrease of 7.8 per cent, although showing a small increase over the value of the products of the state for the decade.

TABLE 2.—CAPITAL INVESTED IN MACHINERY, TOOLS, AND IMPLEMENTS, VALUE OF PRODUCTS, AND AVERAGE AMOUNT OF INVESTMENT REQUIRED FOR A PRODUCT VALUED AT $100: BY STATES, 1890 AND 1900, WITH PER CENT OF INCREASE.

STATES.	Year.	Machinery, tools, and implements.	Value of products.	Average amount of investment in machinery, tools, and implements required for a product valued at $100.	PER CENT OF INCREASE.		
					Machinery, tools, and implements.	Value of products.	Average amount of investment in machinery, tools, and implements required for a product valued at $100.
United States	1900	$16,957,305	$261,028,580	$6.50	22.2	18.3	3.3

[1] Included in "all other states."
[2] No establishments reported.
[3] Includes establishments distributed as follows: 1900—Alabama, 1; Colorado, 1; Delaware, 1; Kansas, 1; Oregon, 2; Tennessee, 2. 1890—Alabama, 1; Delaware, 1; Kansas, 2; Nebraska, 1; Oregon, 1; South Carolina, 2; Tennessee, 2; Texas, 3; Utah, 2; Washington, 1. 1880—Colorado, 1; Idaho, 1; Mississippi, 2; Oregon, 1; West Virginia, 1.

Although the total capital for the United States shows an increase of $6,512,922, there was a decrease shown in reports from 7 states, ranging from $6,990,072 in Massachusetts to $3,899 in Louisiana. Maryland shows a decline in capital of $364,536; Wisconsin, $147,980; California, $482,429; Kentucky, $25,784; and North Carolina, $80,300. Louisiana, Maryland, and North Carolina show a decrease in value of products from 1890 to 1900. There was also a decrease in the average number of wage-earners in these states, except Wisconsin, although the returns for the United States, as a whole, show an increase of 9,232. On the other hand, each of the states showing a falling off in capital, and decrease in the number of wage-earners, except

California, reports an increase in the value of products, amounting, in the case of Wisconsin, to $1,819,451, or 61.2 per cent of the total of $2,972,233 in 1890. Of the geographic divisions, New England, in 1900, employed by far the largest capital, $52,174,549, or $1,276,932 in excess of one-half of the total for the industry in the United States. The average number of wage-earners, men, women, and children, in New England shoe factories was 78,167, or 54.7 per cent of the total, while the value of products for that section was $155,367,997, or 59.5 per cent of the total for the United States.

Of the New England states, in 1900, Maine occupied the position, as regards capital, that was held by Missouri in 1890, that of seventh in rank; though in the matter of product, Maine was sixth in 1900, and Missouri was eighth. Maine shows a gain in capital of $343,332, or 7.1 per cent, and an increase in product of $1,960,505, or 19 per cent. Compared with 1880, the gain in capital was 276.1 per cent, and in product 111.1 per cent. From 1890 to 1900, New Hampshire's gain in capital was $4,166,707, or 105.3 per cent, and in product, $11,419,555, or 95.3 per cent. For the same decade, Connecticut reports an increase in capital of 15.6 per cent, but shows a slight falling off in product, amounting to 1.2 per cent. Vermont and Rhode Island both show gains in capital and product, the latter aggregating $345,699 for the two states. Massachusetts shows a decrease in capital of $6,990,072, or 15.7 per cent, while the value of the product increased $727,343. From 1880 to 1900 the increase was $21,214,733.

Massachusetts, while first in rank in every item relating to shoe manufacture, shows a loss in the number of wage-earners of 8,729, or 13.0 per cent, in a total of 58,645 for 1900. The wages show nearly the same decrease, or 14.3 per cent, indicating a slight falling off in this item.

New Hampshire, which ranks second in New England as regards capital, wages, and products, ranks fourth in the United States in the number of wage-earners. This state shows an output valued at $23,405,558, with 12,007 wage-earners, who received $4,971,954. In 1890 it required 7,912 workers to produce $11,986,003, while $7,230,804 was produced by 4,434 wage-earners in 1880, the state then ranking fourth in all items except that of capital.

In 1900, Ohio in the matter of capital occupied fourth place, which was held by Maine in 1890, and by Illinois in 1880, and had 12,718 wage-earners, who earned $3,989,744; the products were valued at $17,920,854.

Illinois shows a gain in capital, in the number of wage-earners, wages paid, and the value of products. In capital the state stands sixth, as it also does in the total wages paid; but it ranks eighth in the number of wage-earners, and seventh in the value of products. The gain by this state since the census of 1880 represents $3,622,282 in capital, 3,493 in the number of wage-earners, and $8,251,816 in value of products.

Compared with the capital invested each wage-earner in the United States represented $712 in 1900, being about the same as in 1890. The largest amount of capital per wage-earner, $1,265, is reported from California. Of the other states having $1,000,000 capital and upward, Illinois has $964 invested for each wage-earner: Maine, $800; Massachusetts, $641; Michigan, $1,017; Minnesota, $1,105; New Hampshire, $677; New Jersey, $713; New York, $759; Pennsylvania, $750; Ohio, $594, and Wisconsin, $987. The increase in the average number of wage-earners from 1880 to 1890 was 20.3 per cent, and but 6.9 per cent during the decade from 1890 to 1900.

The Middle states, comprising New York, New Jersey, Pennsylvania, Delaware, Maryland, and the District of Columbia, employed capital amounting to $22,496,583, or 22.1 per cent of the total. The average number of wage-earners represents 21.2 per cent of the whole, while the product aggregates $46,928,760, or 18 per cent of the total. Of these states, Pennsylvania made the largest gain in capital over 1890, $1,465,681 in a total of $6,860,480, or 27.2 per cent. From 1890 to 1900 the average number of wage-earners in Pennsylvania increased from 7,616 to 9,144, while the value of the products increased from $10,354,850 to $13,235,933, a gain of $2,881,083, or 27.8 per cent.

New York still ranks second in the amount of capital, average number of wage-earners, and value of products. From 1890 to 1900 the gain in capital was but $32,348 in a total of $11,983,239, while the output increased from $23,661,204 to $25,585,631.

New Jersey, though reporting an increase of $342,157 in capital, shows a falling off both in the average number of wage-earners and the value of products, the decrease for the latter item being $277,366.

With the exception of Virginia and Georgia, every Southern state engaged in the shoe-manufacturing industry shows a decline in the amount of capital, aggregating, for the entire section, $109,983, or 22.9 per cent.

In 1900 North Carolina had a capital of $37,700, or $80,300 less than at the census of 1890.

In 1900 Kentucky had a capital of $254,382, against $280,166 in 1890; while Louisiana has $289,345, compared with $293,244. This decrease, however, does not indicate in every case a falling off in the product. For instance, Kentucky, while showing a decline in capital of $25,784, had an increased output of $103,971 in a total of $630,358. Louisiana, on the other hand, with a capital only $3,899 less than in 1890, shows a decrease of $307,030 in the value of its products.

The increase in the product from 1890 to 1900 was 18.3 per cent, or about three times the percentage of increase in the number of wage-earners. This is accounted for by the greater efficiency of machinery and the perfection of the factory system, which allows the largest output at the minimum expenditure of labor. The manufacture of boots and shoes, particularly in the

Eastern states, is to-day carried on under as favorable conditions, as regards the economical use of labor, modern machinery, and general factory appliances, as any other line of manufacture. This accounts for the low average cost of factory-made boots and shoes, as shown by Table 10.

The Eastern states are producing more per wage-earner than is the case where shoe manufacture is a newer industry. For instance, in Massachusetts the average product per wage-earner was $1,997.02, while in Michigan it was $1,714.57. In Maine the average was $1,911.67; in Missouri, $1,902.49; and in Ohio, $1,409.09.

It will be seen by the foregoing that while New England is still far in the lead in the production of boots and shoes, employing more than half the total capital and manufacturing considerably more than half of the entire shoe output, the Western states have made large gains during the last decade, though not so large as was generally expected. For, marked as the gain in the West has been, amounting to more than 75 per cent, it is but little more than half the total increase for the United States.

That Massachusetts has not made a larger gain is compensated for in the increase in New Hampshire and Maine, both in the same section; the increase in the first-named state alone being equal to the entire production of either Illinois or Missouri.

The advance made by Ohio is notable, as in passing from the seventh rank to that of fourth, the state takes a position in advance of Pennsylvania, Maine, and Illinois.

Michigan, though losing 7.3 per cent, holds its relative position.

Table 4 shows for 1900 the quantity and cost of each kind of leather used in the manufacture of footwear during the census year; the cost of findings, linings, trimmings, and other sundries; the amounts paid for fuel, power, heat, mill supplies, and all other materials; and the kinds, quantity, and value of the products.

TABLE 4.—MATERIALS AND PRODUCTS: CLASSIFIED BY NUMBER OF ESTABLISHMENTS, 1900.

	Number of establishments.	Unit of measure.	Quantity.	Cost of materials used.
Materials: Total				$169,604,054
Sole leather	946	Pounds	178,504,837	39,192,300
Split leather	273	Pounds	15,817,460	3,109,729
Calf and kip skins	420	Pounds	10,569,581	7,069,408
Grain and other side leather	587	Square feet	131,542,365	15,950,818
Goatskins	1,019	Square feet	233,050,841	35,398,638
All other upper material	881	Square feet	98,866,823	15,578,659
Sheep and leather linings and trimmings.	1,322			7,429,156
Cut soles, taps, heels, etc., purchased.	986			17,248,898
Findings, purchased	1,553			12,902,750
Fuel, rent of power and heat, mill supplies, freight, and all other materials.				15,723,698

TABLE 4.—MATERIALS AND PRODUCTS: CLASSIFIED BY NUMBER OF ESTABLISHMENTS, 1900—Continued.

	Number of establishments.	Unit of measure.	Quantity.	Value of products.
Products: Total			219,235,419	$261,028,580
Men's boots and shoes	561	Pairs	68,042,839	108,705,938
Boys' and youths' boots and shoes.	389	Pairs	21,080,479	20,799,297
Women's boots and shoes	589	Pairs	65,372,653	82,504,303
Misses' and children's boots and shoes.	652	Pairs	42,043,202	30,319,611
Men's and boys' and youths' slippers.	136	Pairs	4,456,965	2,812,213
Women's, misses' and children's slippers.	279	Pairs	12,655,876	10,146,393
All other kinds	127	Pairs	5,583,405	2,491,511
All other products	161			2,175,738
Amount received for custom or contract work.	148			1,073,576

Table 4 shows that sole leather was the largest item of materials used, 178,504,837 pounds, costing $39,192,300, being required for the total products of 219,235,419 pairs of boots and shoes. Goatskins constituted the largest portion of upper leather, the quantity reported being 233,050,841 square feet, costing $35,398,638—almost equal to the total cost of all other upper leathers. Split leather was used to the amount of 15,817,460 pounds, costing $3,109,729; while there were 10,569,581 pounds of calf and kip skins, costing $7,069,408, and 131,542,365 pounds of grain and other side leather, costing $15,950,818. All other upper material amounted to $15,578,659. Sheep and leather linings and trimmings cost $7,429,156, while cut soles, taps, heels, etc., were purchased, costing $17,248,898. Findings, fuel, power and heat, mill supplies, freight, and all other materials, amounting to $28,626,448, brought the total cost of materials up to $169,604,054. Men's boots and shoes led in the quantity and value of the products, the returns for the census year showing an output of 68,042,839 pairs, valued at $108,705,938. Women's boots and shoes followed with 65,372,653 pairs, valued at $82,504,303, while 42,043,202 pairs of misses' and children's shoes were made, valued at $30,319,611. The average cost of each pair of footwear was $1.19, and, after deducting the 3,016,720 pairs exported, permits a per capita consumption in the United States of 2.8 pairs.

Table 5 shows cities and towns having products valued at $1,000,000 in 1900, ranked by value of products, 1890 and 1900.

TABLE 5.—CITIES AND TOWNS HAVING PRODUCTS OF OVER $1,000,000 IN 1900, RANKED BY VALUE OF PRODUCTS: 1890 AND 1900.

[1] Not reported.

Until well along in the present century little attempt was made to establish the boot and shoe industry outside eastern Massachusetts. However, it was not to be expected that the other enterprising sections of the United States would always remain content to depend entirely on New England for so important an article of merchandise as shoes. In New York city and other cities of New York state, especially Rochester, the industry has attained large proportions and has reached a high state of perfection. In Newark, N. J., where the business was early established, are made many of the finest shoes for men; and in Philadelphia the shoe industry has become very prominent among the manufactures for which that city is celebrated. In Cincinnati and St. Louis shoes are produced in great quantities and of an excellent style and finish. Chicago has taken up the industry with an energy that has already placed her in a prominent position, and she has several factories which equal those of older shoe-manufacturing centers.

In fact, all through the West, including the Pacific coast, there are scores of thoroughly equipped and financially successful shoe factories. It will be noticed that some cities, well up in the scale in 1900, were not reported in 1890, thus precluding any comparison of them during the decade. It must not be inferred, however, that no shoes were manufactured in those places in 1890. At the Eleventh Census only 165 principal cities were reported by specified industries. Several cities and towns named in the table produced boots and shoes in considerable quantities in 1890, but, as their manufacturing statistics were not shown separately, no figures are available for purposes of comparison. They appear in Table 5 as not reporting for 1890, but are ranked according to the output for 1900.

Lynn, Mass., which has been foremost as a shoe center for one hundred and seventy-five years, changes places in the census of 1900 with Brockton, Mass., as the largest producer of boots and shoes, the latter city having an output of $19,844,397. This is $346,298 less than Lynn is reported to have produced in 1890, but $3,013,664 more than was turned out in 1900. Haverhill, Mass., which ranks third in 1900, held the same position in 1890, though her output shows a decrease of $905,912. The decrease in the output of Lynn and Haverhill, shown by the returns for 1900, is undoubtedly due in a measure to the fact that the business for the census year was below normal, and the decrease in the value of products of Lynn is still further explained by the fact that just previous to the present census year one of the largest shoe manufacturing establishments in the city removed its entire business to Boston.

In 1900 Cincinnati, Ohio, takes fourth place, which was occupied at the Eleventh Census by Chicago, the latter city having dropped 5 numbers in the meantime.

Philadelphia's standing changed from fifth to seventh place and had a reduced output.

Remarkable gains are shown by several cities, one of the most notable being Manchester, N. H. In 1890 this city ranked twenty-third, with an output of $39,024; in 1900 it ranked eleventh, the production having increased to $4,052,204.

St. Louis, Mo., has nearly doubled the value of its product, which, in 1900, amounted to $8,286,156, compared with $4,250,960 in 1890. Boston made $3,882,655 worth of boots and shoes in 1900, compared with $1,508,697 in 1890.

Auburn, Me., not reported among the 165 principal cities ten years ago, ranks tenth, with an output of $4,176,826 in 1900.

Marlboro, Mass., showing a product of $3,852,931 with the rank of 13 would, under normal local conditions, be entitled to a much higher place, but unfortunately labor difficulties during a portion of the Census year are said to have reduced the output of the factories located there nearly one-half.

Columbus, Ohio, which stood twentieth at the Eleventh Census, with an output valued at $359,000, in 1900 is fifteenth in rank, with products valued at $3,505,126.

New York city shows a falling off of $1,915,348, during the decade, its rank having been reduced from eighth to seventeenth.

Chicago shows a decrease of $1,533,908 in the value of products for 1900, and drops from fourth to ninth place. The total in 1890 was $7,257,034.

St. Paul, Minn., while ranking thirty-fourth instead of twenty-second as in 1890, shows an increase of $1,512,624 in value of its output, and Minneapolis, Minn., increased from $211,684 in 1890 to $1,008,007 in 1900, although changing its rank from twenty-first to fifty-third.

Worcester, Mass., which stood eleventh in 1890, ranks as thirty-sixth, with an output of $1,610,605 in 1900, as compared with $2,923,545 at the Eleventh Census.

San Francisco, Cal., which ranked tenth in 1890, with products valued at $3,315,043, drops to thirty-fifth in 1900, and the value of its output decreased to $1,618,514.

It will be seen that 3 Massachusetts cities, Brockton, Lynn, and Haverhill, produced 27.4 per cent of the total for the 54 principal cities, while all the Massachusetts cities and towns in the list turned out 53.0 per cent of the total for cities and towns, having a product exceeding $1,000,000 each.

Table 6 shows the average number of men, women, and children employed in the industry, and the changes that have taken place in the employment of these classes in the United States as a whole, and in the several states, since the taking of the Eleventh Census.

[1] Included in "all other states."

[2] Includes establishments distributed as follows: 1900—Alabama, 1; Colorado, 1; Delaware, 1; Kansas, 1; Oregon, 2; Tennessee, 2. 1890—Alabama, 1; Delaware, 1; Kansas, 2; Nebraska, 1; Oregon, 1; South Carolina, 2; Tennessee, 2; Texas 3; Utah, 2; Washington, 1.

It will be noted that there has been a marked gain in the number of women and children, and a decrease in the number and percentage of men employed. This is accounted for by the growing tendency to substitute women for men in many of the departments of shoe manufacture, and the turning over to children of the work heretofore done by women. As a consequence, the number of women and children employed furnished a larger ratio of the total than has formerly been the case. The total average number of wage-earners reported in 1900 was 142,922, and in 1890, 133,690, an increase of 9,232, or 6.9 per cent. Men of 16 years and over numbered 91,215 in 1900, against 91,406 in

1890, a decrease of 191, or two-tenths of 1 per cent. There were 47,186 women employed in 1900, and 39,849 in 1890, an increase of 7,337, or 18.4 per cent. Children under 16 years were employed to the number of 4,521 in 1900 and 2,435 in 1890, an increase of 2,086, or 85.7 per cent.

The percentage of men decreased from 68.4 per cent to 63.8 per cent, while the percentage of women increased from 29.8 per cent to 33 per cent, and that of children from 1.8 per cent to 3.2 per cent. The largest number employed at any one time, as shown in Table 10, printed elsewhere in this report, was 169,912, and the smallest number was 116,436. February and March show the greatest activity in shoe manufacture, the total number employed in the first month being 148,015, and in the latter 149,728, or 5,093 more in February and 6,806 more in March than the average for the year.

The only state employing men exclusively was North Carolina; while another Southern state, Kentucky, reports the smallest proportion of men, 45.4 per cent. Massachusetts shoe factories, which employ 58,645 workers, have 66.5 per cent men, 31.8 per cent women, and 1.7 per cent children. New York, which follows Massachusetts, employs 15,796 wage-earners—61.8 per cent men, 34.7 per cent women, and 3.5 per cent children.

Practically all the shoe manufacturing in Rhode Island during the census year was done by contract, and the number of wage-earners engaged in such work does not appear in the table, the average number employed, outside of those persons performing contract work, being 9—4 men, 4 women, and 1 child.

Vermont has the largest proportion of women employed, 43.7 per cent, but has the smallest percentage of child labor, 0.3 per cent. This is an increase since 1890 of 10.2 per cent for women, and a decrease of 4.1 per cent for children.

New Hampshire, with 12,007 wage-earners, has doubled the percentage of child labor and employs a smaller proportion of adults. In 1900 the percentage of men wage-earners in this state was 64.6 per cent compared with 68.5 per cent, in 1890; of women 32.2 per cent, against 29.9 per cent ten years ago; and of children 3.2 per cent, compared with 1.6 per cent at the Eleventh Census.

Of the increase of 1,561 wage-earners reported for the decade in Illinois, 755, or 48.4 per cent, were women and children. This increase brings the percentage of children from 0.8 per cent in 1890 to 4.2 per cent in 1900, and increases the ratio of women 1 per cent.

Of the other Middle and Western states, Indiana reports an increase in the total number of wage-earners of 437, which, though not changing more than 1 per cent the proportion of the 3 classes employed, shows 71.1 per cent of men, 27.9 per cent of women, and 1 per cent of children. Michigan shows a decreased percentage of men and an increased percentage of women and children for the decade. In Wisconsin child labor constitutes 6.5 per cent in this industry, compared with 1.8 per cent in 1890, and 33.9 per cent was represented by women against 35.7 per cent in 1890.

CONVICT LABOR.

No account of the manufacture of boots and shoes would be complete without reference to the employment of convict labor. The business offers many advantages to the authorities of prisons who are seeking remunerative work for the men and women in their charge. The great number of operations in producing a shoe makes it possible to use all classes of convicts, from the strong to the weak; and as far back as 1850, even before machinery was introduced, it was not an uncommon thing for houses of correction and prisons to produce footwear not only for their own convicts, but to be sold in the market. After the introduction of machinery, and during the demand for cheap shoes which followed the close of the Civil War, many of the states leased the labor of their convicts to shoe manufacturers. In the year 1870 there were employed in this industry in 26 different states 6,581 convicts, while there were only 129,989 employed in the industry in the same states outside the prisons. In the fiscal year 1886 there were made by 7,609 convicts, 6,634,960 pairs of shoes, valued at $10,990,173, and it is probable that the number employed and the annual production are steadily increasing. In states where the system was believed to have a harmful influence on the wages of the workman outside the prisons, the business has been conducted on the states' account, and in some instances, at least, the result has been disastrous. Attempts have been made, in the supposed interest of labor, to forbid prison authorities to use the convicts in any industry which would compete with outside labor. At the present time, in view of the fact that the boot and shoe factories of the United States can produce in nine months all of the shoes required for consumption in twelve months, and that convicts must be worked nearly every week day of the year, their employment at shoemaking must have more or less effect on the market.[1]

Table 7 shows the kinds, quantity, and value of the boots and shoes manufactured in 1890 and 1900.

TABLE 7.—COMPARATIVE SUMMARY, 1890 AND 1900, KINDS, QUANTITY, AND VALUE OF PRODUCTS, WITH PER CENT OF INCREASE.

	1900	1890	Per cent of increase.
Total number of pairs	219,235,419	173,862,940	26.1
Total value of products	$261,028,580	$220,649,358	18.3
Boots and shoes for men, youths, and boys—			
Number of pairs	89,123,318	67,740,489	31.6
Value	$129,505,235	$97,496,514	32.8
Boots and shoes for women, misses, and children—			
Number of pairs	107,415,855	106,122,451	1.2
Value	$112,823,914	$115,655,533	[1]2.4
Slippers for men, youths, and boys—			
Number of pairs	4,456,965	(2)	
Value	$2,812,213	(2)	
Slippers, oxfords, and low cuts for women, misses, and children—			
Number of pairs	12,655,876	(2)	
Value	$10,146,393	(2)	
All other kinds—			
Number of pairs	5,583,405	(2)	
Value	$2,491,511	(2)	
All other products	$3,249,314	$7,497,311	[1]56.7

[1] Decrease. [2] Not reported separately.

The total quantity of boots and shoes manufactured in 1900 was 219,235,419 pairs, an increase over 1890 of 45,372,479 pairs, or 20.6 per cent. This is about the same as the percentage of increase in population for the United States. In 1900, 89,123,318 pairs of men's, youths', and boys' boots and shoes were manufactured, valued at $129,505,235, compared with 67,740,489 pairs, valued at $97,496,514, in 1890. Women's, misses', and children's shoes were made to the number of 107,415,855 pairs, valued at $112,823,914, in 1900, and 106,122,451 pairs, valued at $115,655,533, in 1890. Slippers, which were reported separately for the first time at the Twelfth Census, were produced for men, youths, and boys to the number of 4,456,965 pairs, valued at $2,812,213. Another new item in 1900, "slippers, oxfords, and low cuts for women, misses, and children," is represented by 12,655,876 pairs, valued at $10,146,393. In the 1890 report slippers of all kinds, oxfords, and low cuts, were classified generally under the head of "boots and shoes," and no separate report was given. This new classification accounts for the apparently small increase in the number of women's, misses', and children's shoes, and the decrease of 2.4 per cent in value during the decade. The total product for 1900 was valued at $261,028,580, compared with $220,649,358 in 1890, an increase of $40,379,222, or 18.3 per cent.

The following tabular statement shows the value of the exports of leather boots and shoes from 1870 to 1901:[1]

YEARS.	Values.	YEARS.	Values.
1901	$5,526,290	1893	$590,754
1900	4,276,656	1892	914,974
1899	2,711,385	1891	651,343
1898	1,816,538	1890	662,974
1897	1,708,224	1885	598,151
1896	1,436,686	1880	441,069
1895	1,010,228	1875	429,363
1894	777,354	1870	419,612

[1] Statistical Abstract of the United States Treasury Department.

Early manufacturers shipped goods to the West Indies, more especially to Cuba, and up to the time of the Civil War the export business was prosecuted with considerable vigor and profit. In 1810, 10 per cent of all the boots and shoes sold in Boston were for export. In the year 1865 shoes to the value of more than $2,000,000 were exported. From that time the trade fell off sharply. This may be accounted for by the great advance in 1866, when values rose at least 50 per cent. Within the last few years interest has been renewed in the export trade. Manufacturers have become convinced that there is nothing in the conditions which will prevent competition with foreign countries. The raw materials are available, and, while many hides and skins are imported, the supply of the domestic product is constantly increasing and leather manufacturers have been able to produce materials for making boots and shoes as advantageously, both in regard to quality and price, as any other country. Styles have been adapted to the wants of such countries as import their footwear. Many of the leading manufacturers are alive to the situation and are endeavoring to secure a greater share of the world's trade.

The exports, with the exception of the year 1865, appear to have been unimportant until 1895, when the first decided gain was made, the exports for that year being valued at $1,010,228. Since that date there has been a steady increase until, in 1901, these exports amounted to $5,526,290. The maximum yearly capacity of the combined factories of the United States, on a basis of three hundred working days, is slightly under 400,000,000 pairs, showing that all the factories running at full capacity would require not exceeding seven months to produce all shoes consumed in the United States, and those exported for the year ending June 30, 1900.

Table 8 shows, by states, the average amount of capital required to produce $100 worth of boots and shoes at the Tenth, Eleventh, and Twelfth censuses.

TABLE 8.—AVERAGE AMOUNT OF CAPITAL REQUIRED FOR A PRODUCT VALUED AT $100: 1880, 1890, AND 1900.

STATES.	Year.	Capital.	Value of products.	For $100 of product.

[1] No establishments reported.
[2] Included in "all other states."
[3] Includes establishments distributed as follows: 1900—Alabama, 1; Colorado, 1; Delaware, 1; Kansas, 1; Oregon, 2; Tennessee, 2. 1890—Alabama, 1; Delaware, 1; Kansas, 2; Nebraska, 1; Oregon, 1; South Carolina, 2; Tennessee, 2; Texas, 3; Utah, 2; Washington, 1. 1880—Colorado, 1; Idaho, 1; Mississippi, 2; Oregon, 1; West Virginia, 1.

Capital in 1890 and 1900 included that invested in land, buildings, and machinery, tools, and implements, together with live capital either owned or borrowed. For the United States, in 1900, the average capital was $39 for every $100 of product against $43.18 in 1890 and $25.89 in 1880. Table 8 shows that there was a wide difference in the amounts required in different sections of the country to manufacture a product valued at $100. This is explained by the varying conditions under which the business was carried on. In 1900 the two extremes appeared to be Rhode Island, requiring $23.77, and California, $67.97. California's excessive average is due to the fact that the value of the products in the state decreased from $3,395,043 in 1890 to $1,850,511 in 1900, or 45.5 per cent, while the capital decreased in a lesser ratio, from $1,740,175 to $1,257,746, or 27.7 per cent. During the same period the number of establishments declined from 56 to 30, a loss of 26, which undoubtedly accounts for a part of the loss in value of products; though in consideration of the comparatively slight reduction in the amount of capital, it would appear that the loss in establishments was of the class using small capital.

Consequently, it is evident that while the larger portion of the capital remained in the business in 1900, the product was considerably below normal, thereby adding materially to the amount of capital reported for a product of $100. Other states with a product in excess of $1,000,000, which reported more than $50 invested for each $100 of product during the census year are as follows: Minnesota, $61.88 against $88.20 in 1890; Michigan, $59.32 against $47.08 in 1890; Connecticut, $52.04 against $44.50 in 1890; Wisconsin, $51.62 against $88.20 in 1890; and Pennsylvania, $51.83 against $52.10 in 1890. It will be noticed that the amount invested by Minnesota and Wisconsin in 1890 was precisely the same, $88.20 being the amount shown in each state; while in 1900 Wisconsin showed a reduction to $51.62 and Minnesota to $61.88. Wisconsin manufactured products valued at $4,791,684 in 1900 against $2,972,233 in 1890, with $147,980 less of capital than in 1890; while Minnesota produced $3,615,801 in 1900 compared with $2,032,814 in 1890, with an increase of $442,829 in capital.

Pennsylvania shows an increase in product over 1890 of nearly $3,000,000, with an increase of a little less than $1,500,000 in capital, showing a variation between the two censuses of only 27 cents in the amount required for a product of $100.

Michigan shows an increase of $12.24 in the capital invested for $100 of product; the capital for that state having increased $163,427, while the product was $150,352 less than in 1890.

Illinois shows an increase of $1,570,006 in capital and $2,678,018 in product; a capital of $46.80 was required for $100 of product in 1900 compared with $43.18 in 1890.

In Missouri the capital required for $100 of product diminished more than one-half during the past ten years, showing $76.70 in 1890 and $37.18 in 1900. During the decade the value of the products increased $6,412,198, while the capital increased only $471,064. This is probably due to the fact that about the year 1890 an extensive development of the industry began in that state and a large amount of capital was invested, the benefits of which were not fully realized until after the returns for the census of 1890.

The products of the state of New York show an increase of nearly $2,000,000, while the growth of capital is represented by the comparatively small sum of $32,348; thus reducing the amount required for a product of $100 from $50.51 in 1890 to $46.84 in 1900.

Maryland shows a material reduction in the amount of capital required for a product of $100 in 1900, $44.25 having been used against $56.33 in 1890.

New Jersey shows an increase of $6.45 in the average capital required, or from $38.74 in 1890 to $45.19 in 1900, with a small loss in value of products, and an actual increase in capital of $342,157.

Ohio reports an increase of $4.71 in the average capital employed, $42.12 having been required in 1900 against $37.41 in 1890. The product was more than doubled during the decade, and the total capital increased $4,372,824.

Virginia shows an increase of $4.92, or from $39.22 to $44.14, with small increases in production and capital.

With the exception of those located in Connecticut, the factories in the New England states reporting a product of more than $1,000,000, generally shows a smaller amount of capital required for a product of $100 than in states located in other sections of the United States. Maine reported $41.87 in 1900 against $46.49 in 1890; New Hampshire shows an increase of $1.70, or from $33.01 to $34.71, with an increase of more than 100 per cent in the amounts of product and capital; Massachusetts shows a decrease of $6.20 in the amount employed for a product of $100, or $32.09 in 1900 against $38.29 in 1890; the products increased $727,343 and the capital diminished $6,990,072.

The wide variation in the amount of capital employed in the different states where boot and shoe manufacturing is carried on is accounted for in various ways. That the Western, Middle, and Southern states employ a larger capital than the New England states is due in a measure to the fact that many of the manufacturers in those states dispose of a larger proportion of their products directly to the retail dealer than is the case in New England. This requires oftentimes longer credits than is required when the product is sold to the "jobber;" and, in addition to this, manufacturers selling to the retail trade are required to carry in stock a considerable quantity of manufactured goods in order to promptly supply their customers when the goods are wanted. Furthermore the manufacturers in the Western, Middle, and Southern states are farther from the source of supply and are generally obliged to buy their raw materials in larger quantities than the manufacturers located in the New England states.

Table 8 also shows that the average capital employed for a product of $100 in 1900 was $4.18 less than that employed in 1890. A comparison of figures indicates that the shoe manufacturers of the United States turned their capital 2.56 times in 1900, and 2.31 times in 1890. In almost every instance the capital employed in 1880 was very much less than in 1890 or in 1900. In 1880 manufacturers bought their materials on long credits and did not employ the vast amount of machinery which is to-day required to carry on a successful shoe-manufacturing business. The factories were run almost twelve months in the year, while the business as conducted to-day requires that most of the product should be made in a much shorter time, thus necessitating the use of larger capital. The business in 1880 was conducted on a much smaller scale, and was carried on in comparatively inexpensive buildings, while to-day the magnitude of the business frequently requires the occupancy of immense structures of iron, brick, and stone, representing a larger amount of capital invested.

There were 2 educational, 1 eleemosynary, and 3 penal institutions returned as engaged in the manufacture of boots and shoes during the census year, using materials costing $215,110, with products valued at $269,476.

Twenty-three idle boot and shoe factories were reported in 1900. The total capital of these establishments was $413,018, divided as follows: Land, $32,560; buildings, $103,400; machinery, tools, and implements, $154,171; and cash and sundries, $122,887.

HISTORICAL AND DESCRIPTIVE.

Early History.—Few industries, in their evolution, offer a more interesting history than the manufacture of boots and shoes. Supplying, as the shoemaker does, a necessity common to all civilized people, his progress is due to the fact that the number of wearers increases each year, and the demand for his products continues in an ever-widening ratio. The history of this branch of manufacturing, as it has progressed from the shoemaker's bench, where shoes were turned out one at a time, to the modern factory with its output of thousands of pairs daily marks, as do few others, the remarkable industrial progress of the present age.

The introduction of the boot and shoe industry in America is almost coincident with the first settlement of New England, for it is a matter of history that in the year 1629 a shoemaker named Thomas Beard, with a supply of hides, arrived on board the Mayflower. This pioneer of the American boot and shoe trade was accredited to the governor of the colony, by the company in London, at a salary of £10 per annum and a grant of 50 acres of land, upon which he should settle. Seven years after the arrival of Beard, the city of Lynn saw the inception of the industry which has given it a world-wide fame, for there, in 1636, Philip Kertland, a native of Buckinghamshire, began the manufacture of shoes and fifteen years later the shoemakers of Lynn were supplying the trade of Boston. As early as 1648, we find tanning and shoemaking mentioned as an industry in the colony of Virginia, special mention being made of the fact that a planter named Matthews employed 8 shoemakers upon his own premises. Legal restraint was placed upon the business of the cordwainer in Connecticut, in 1656 and in Rhode Island in 1706, while in New York the business of tanning and shoemaking is known to have been firmly established previous to the capitulation of the province to the English, in 1664. In 1698 the industry was carried on profitably in Philadelphia, and in 1721 the colonial legislature of Pennsylvania passed an act regulating the materials and the prices of the boot and shoe industry.[1]

During the Revolution most of the shoes worn by the Continental army, as well as nearly all ready-made shoes sold throughout the colonies, were produced in Massachusetts, and we find it recorded that "for quality and service they were quite as good as those imported from England." Immediately after the Revolution, in consequence of large importations, the business languished somewhat. It soon recovered, however, and was pursued with such vigor that in 1795 there were in Lynn 200 master workmen and 600 journeymen, who produced in the aggregate 300,000 pairs of ladies' shoes. One manufacturer in seven months of the year 1795 made 20,000 pairs. In 1778 men's shoes were made in Reading, Braintree, and other towns in the Old Colony for the wholesale trade; they were sold to dealers in Boston, Philadelphia, Savannah, and Charleston, a considerable portion being exported to Cuba and other West India islands.

About the year 1795 the business was established in Milford and other Worcester county towns, where brogans were made, and sold to the planters in the Southern states for negro wear. The custom at this time was for the manufacturer to make weekly trips to Boston with his horse and wagon, taking his goods in baskets and barrels, and selling them to the wholesale trade.[2]

Early Methods.—Prior to 1815 most of the shoes were hand sewed, a few having been copper nailed; the heavier shoes were welted and the lighter ones turned. This method of manufacture was changed, about the year 1815, by the adoption of the wooden shoe peg, which was invented in 1811 and soon came into general use. Up to this time little or no progress had been made in the methods of manufacture. The shoemaker sat on his bench, and with scarcely any tools other than a hammer, knife, and wooden shoulder stick, cut, stitched, hammered, and sewed, until the shoe was completed. Previous to the year 1845, which marked the first successful application of machinery to American shoemaking, this industry was in the strictest sense a hand process, and the young man who chose it for his vocation was apprenticed for seven years, and in that time was taught every detail of the art. He was instructed in the preparation of the insole and outsole, depending almost entirely upon his eye for the proper proportions; taught to prepare pegs and drive them, for the pegged shoe was the most common type of footwear in the first

[1] Eighth Census of United States, 1860. Manufactures, page 67.

[2] One Hundred Years of American Commerce, published 1895: The Boot and Shoe Trade; William B. Rice, Vol. II, pages 566 to 574.

half of the last century; and familiarized himself with the making of turned and welt shoes, which have always been considered the highest type of shoemaking, requiring exceptional skill of the artisan in channeling the insole and outsole by hand, rounding the sole, sewing the welt, and stitching the outsole. After having served his apprenticeship, it was the custom for the full-fledged shoemaker to start on what was known as "whipping the cat," which meant traveling from town to town, living with a family while making a year's supply of shoes for each member, and then moving on to fill engagements previously made.

The change from which has been evolved our present factory system, began in the latter part of 1700, when a system of sizes had been drafted, and shoemakers more enterprising than their fellows gathered about them groups of workmen, and took upon themselves the dignity of manufacturers. The entire shoe was then made under one roof, and generally from leather that was tanned on the premises; one workman cut the leather, others sewed the uppers, and still others fastened uppers to soles, each workman handling only one part in the process of manufacture. This division of labor was successful from the very start, and soon the method was adopted of sending out the uppers to be sewed by the women and children at their homes. Small shops were numerous throughout certain parts of Massachusetts where the shoemaker, with members of his family or sometimes a neighbor, received the uppers and understock from the factories near by, bottomed the boots and shoes, and returned them to the factories, where they were finished and sent to the market packed in wooden boxes. Thus the industry developed and prospered and was carried on without any further improvement in methods until the introduction of machinery a little more than a half century ago.

Machinery.—The first machine which proved itself of any practical value was the leather-rolling machine, which came into use about 1845 and with which it was said "a man could do in a minute what would require half an hour's hard work with a lapstone and hammer." This was closely followed by the wax-thread sewing machine, which greatly reduced the time required for sewing together the different parts that formed the upper, and the buffing machine, for removing the grain from sole leather. Then came a machine which made pegs very cheaply and with great rapidity, and this in turn was followed by a hand-power machine for driving pegs. In 1855 there was introduced the splitting machine, for reducing sole leather to a uniform thickness. Peg-making and power-pegging machines were soon perfected and there had appeared a dieing-out machine, which was used for cutting soles, taps, and heels by the use of different sized dies. The year 1860 saw the introduction of the McKay sewing machine, which has perhaps done more to revolutionize the manufacture of shoes than any other single machine. The shoe to be sewed was placed over a horn and the sewing was done from the channel in the outsole through the sole and insole. The machine made a loop stich and left a ridge of thread on the inside of the shoe, but it filled the great demand that existed for sewed shoes, and many hundreds of millions of pairs have been made by its use.

At the time of the introduction of the McKay machine inventors were busy in other directions, and, as a result, came the introduction of the cable nailing machine, which was provided with a cable of nails, the head of one being joined to the point of another; these the machine cut into separate nails and drove automatically. At about this time was introduced the screw machine which formed a screw from brass wire, forcing it into the leather and cutting it off automatically. This was the prototype of the "rapid standard screw machine," which is a comparatively recent invention and is very widely used as a sole fastener at the present time on the heavier class of boots and shoes. Very soon thereafter the attention of the trade was attracted to the invention of a New York mechanic for the sewing of soles. This device was particularly intended for the making of turn shoes and afterwards became famous as the Goodyear "turn shoe machine." It was many years before this machine became a commercial success, and mention of its progress is made later.

Closely following the Goodyear invention came the introduction of the first machine used in connection with heeling—a machine which compressed the heel and pricked holes for the nails—and this was soon followed by a machine which automatically drove the nails, the heel having previously been put in place and held by guides on the machine. Other improvements in heeling machines followed with considerable rapidity, and a machine came into use shortly afterwards which not only nailed the heel but was also provided with a hand trimmer, which the operator swung round the heel immediately after nailing. From these have been evolved the heeling machines in use at the present time.

Notable improvements had during this time been made in the Goodyear system, and a machine was made for the sewing of welts which was the foundation of the Goodyear machine now so universally used. This machine sewed from the channel of the insole through upper and welt, uniting all three, and was a machine of the chain-stitch type which left the loop on the outside of the welt. This machine was closely followed by the introduction of one which stitched the outsole, uniting it to the welt by a stitch made from the channel in the outsole, through outsole and welt. This machine afterwards became famous as the Goodyear "rapid outsole lock-stitch machine." The great demand that existed for shoes of this type made it necessary that accessory machines should be invented, and those which prepared the insole, skived the welt, trimmed the insole, rounded and channeled the outsole, as well as a machine which automatically rolled or leveled the shoe, and the stitch separating machine were soon produced. These formed the Goodyear welt system which has been the subject of constant improvement up to the present time and is now in use wherever shoes of a higher class are made.

At the time the first standard screw machine was attracting attention, the heel-trimming and forepart-trimming machines were brought out. This part of the work had previously been done by the hand workman, using a shave or knife for trimming, and as he was entirely dependent upon the eye for the proper proportions of the finished sole, the work was not often of a very uniform nature. The heel and forepart trimming machines greatly reduced this part of the labor, and their adoption was very rapid.

In the early seventies came a change in a department of shoemaking which, prior to that time, had been regarded as a confirmed hand process. This was the important part of the work known as lasting; and a machine was introduced at that time for doing this work. This machine, as well as those which followed afterwards for a period of twenty years, was known as the bed type of machine, in which the shoe upper was drawn over the last by either friction or pincers, and then tacked by the use of a hand tool. At a comparatively recent period another machine which revolutionized all previous ideas in lasting was introduced. This machine is generally in use at the present time and is known as the "consolidated hand-method lasting machine." It was fitted with pincers which automatically drew the leather round the last, at the same time driving a tack which held it in place. This machine has been so developed that it is now used for the lasting of shoes of every type, from the lowest and cheapest to the highest grade, and it is a machine that shows wonderful mechanical ingenuity.

The perfecting of the lasting machine has been followed recently by the introduction of a machine which performs in a most satisfactory way the difficult process known as "pulling over," which consists of accurately centering the shoe upper on the last and securing it temporarily in position for the work of lasting. The new machine, which is known as the hand-method pulling-over machine, is provided with pincers, which close automatically, gripping the shoe upper at sides and toe. It is fitted with adjustments by which the operator is enabled to quickly center the shoe upper on the last, and, on the pressing of a foot lever, the machine automatically draws the upper closely to the last and secures it in position by tacks, which are also driven by the machine. The introduction of this machine marked a radical change in the one important shoemaking process that had up to this time successfully withstood all attempts at mechanical improvement. At about the time that lasting was first introduced there came the finishing machines, which were used for finishing heel and forepart. These machines were fitted with a tool, which was heated by gas and which practically duplicated the labor of the hand workman in rubbing the edges with a hot tool for the purpose of finishing them. From these early machines have been evolved the edge-setting machines which are in use at the present time.

The latest machine to attract the attention of the trade is one which, in the opinion of those well qualified to judge, is destined to revolutionize the making of that class of shoes which has heretofore been made on the McKay sewing machine. It is known as the "universal double-clinch machine," and forms a fastening of wire, which is taken from a coil corrugated in the machine, and driven, one end being clinched back into the leather of the insole while the driven end is clinched into the leather of the outsole. It is further provided with an attachment which makes the channel in which the fastening is driven and afterwards closes it automatically. It makes a very comfortable, flexible, and durable shoe, and is being rapidly adopted by manufacturers.

At the present time the genius of the American inventor has provided for every detail of shoemaking, even the smallest processes being performed by mechanical devices of some kind. This has naturally made the shoemaker of to-day a specialist, who very seldom knows anything of shoemaking apart from the particular process in the performance of which he is an adept, and from which he earns a livelihood. The American shoe of to-day is the standard production of the world. It is in demand wherever shoes are worn, and although the tools which have made its production possible have been perfected in the face of most discouraging conditions and opposition, they are to-day classed among the most ingenious productions of a wonderfully productive epoch.

Power.—In 1855, William F. Trowbridge, of Feltonville, Mass. (then a part of Marlboro, now the town of Hudson), a partner in the firm of F. Brigham & Co., conceived the idea of driving by horsepower the machines then in use. In a building attached to the factory he established a sweep, around which a horse known for a score of years in that section as the "Old General" provided the first power other than manual which ever drove shoe machinery. For some years prior to that time two or three stout Irishmen had supplied the motive power in this factory. Soon afterwards steam power was used in the factory of John Hill & Co., of Stoneham; and one after another of the larger manufacturers throughout the Eastern states found it necessary to adopt modern methods, so that after the year 1860 there were very few of any pretensions who did not use either steam or water-power to drive their machinery. This opened up the way for numerous improvements. None was of more importance than the Howe sewing machine, which was now brought into general use. Waxed thread sewing machines were also introduced in 1857, by which the uppers of nearly all heavy shoes are stitched together. Buffing machines had been run by foot as far back as 1855, but were now all driven at high speed by power. Power machines for dieing out soles and heels were introduced in 1858.[1]

[1] One Hundred Years of American Commerce, published 1895: The Boot and Shoe Trade; William B. Rice, Vol. II, pages 566 to 574.

The United States Commissioner of Labor, in dealing with boot and shoe manufacture in his report for 1898, has analyzed the different operations through which the factory-made shoe passes in its making, comparing the time needed to carry on the same operation by hand. A portion of the report is reproduced here to show the part that machinery plays in the manufacture of boots and shoes at this time.

To illustrate the difference between hand and machine work, the Commissioner uses seven different and distinct styles and grades of footwear that are fairly representative of the industry. The quantity in each instance is 100 pairs. Following is the list with their unit numbers to which reference is made in making the comparisons.

BOOTS AND SHOES.

Unit No.	Article produced or work accomplished.				Year of production.		Different operations performed.		Different workmen employed.		Time worked.				Labor cost.	
	Name.	Description.		Quantity, pairs.							Hand.		Machine.			
		Hand.	Machine.		Hand.	Machine.	Hand.	Machine.	Hand.	Machine.	Hours.	Minutes.	Hours.	Minutes.	Hand.	Machine.

In discussing the above statement, the Commissioner says:

There is probably none of the older industries of the country in which the introduction of machinery has been more rapid, or has played a more important part in saving time and reducing labor cost, than in that pertaining to the manufacture of boots and shoes. Following the primitive shoemaker, who worked on the bench in his own home making shoes to measure for the community, the first change introduced the old-fashioned shoe shops, which were large enough to accommodate but three or four workmen. Then followed the primitive factory system, in which the greater portion of the work was done by hand and the balance by machinery, and in time this system gradually gave way to the modern factory system in vogue at the present time, in which, with the exception of the upper-cutting department, machinery has almost entirely displaced hand methods.

In 1880, when the subdivision of labor had about reached its limit and the present system had become perfected, efforts were next directed to the production of subordinate parts of the product, which up to that time had received but little attention. This departure has resulted in the gradual and steady growth of a large number of establishments which make a specialty of preparing the rough soles, heels, counters, box toes, welting, etc.

While a large proportion of the operations in each unit are quite similar, there is considerable difference in time. The reason for this will readily be understood when attention is called to the fact that the several units represent entirely different grades of shoes, and that while the description of the machine used, work done, and the occupations may be similar, yet the actual amount of time and energy expended upon each particular part and number of operations required to produce the unit are always regulated by the particular style and quality of the product.

Ordinarily the greatest efficiency is obtained in the production of the cheaper grades of shoes, and a comparison of the aggregate time for the several units shows this to be the case. It frequently happens that in some operations greater efficiency is attained in the higher-grade product. In some operations the time reported appeared somewhat inconsistent, but when the data were submitted for revision and approved by the persons who furnished the information, attention was called to these discrepancies, and in every instance corrections were made or some special reason assigned. In some cases it was due to the difference in the style or quality of the product, or to the use of more modern machinery, while in others the skill of the workmen played an important part, and in a number of instances it was found that where the workmen were paid by the piece, they performed the work in less time than those who were paid by the hour or day. But in every case the data, as published, has been revised and approved by the parties who furnished the original information, and the results shown are considered to be as nearly correct as it is possible to make them.

Lasts and Patterns.—An important feature of the boot and shoe industry is the use of lasts and the system of last measurements adopted by manufacturers. In the early fifties the methods in last and pattern making were very crude, although some of the boots and shoes made in those days were very fine in workmanship, and the amount paid to a workman for simply putting on the bottoms which was done by hand would, at the present time, purchase a good pair of shoes. Lasts were then made only in whole sizes, such a thing as half sizes being unheard of, and were of curious shapes; first, they would have very broad toes, then would go to the other extreme and run out so thin at the end that it was necessary to iron plate them. There were only two or three styles and widths, and one pattern would fit them all. Many of the women's lasts were made straight. Very little attention was given to the saving of stock in those days, and in the making of patterns one had only to get them large enough. At the present day the saving of stock in the making of patterns is of the greatest importance. The measurements must be absolutely retained. The character and style must be kept up; and the lines, proportions, and graceful curves must receive the most careful attention in all their details, as these are necessary to make up the symmetrical whole. The early method of producing patterns was largely by guess, and some, it is said, still cling to the old way. At one time what was called the English system was considerably used, the method being to take a piece of upper leather, wet and crimp it over the last, and let it dry. This gave the form of the last, and then the pattern was cut from stiff paper allowing for laps, seams, and folds. This method gave good results, providing that the person using it had good taste in putting style into the pattern. Later came the Radii system, which some are using at the present day. Still later came the Soule method, and a book was published describing that system. This method, which is said to produce very good results, is still being used by many pattern manufacturers, and also by local shoe-pattern makers in many of the shoe factories of the country. Some of the most enterprising pattern makers of to-day, however, are using more modern methods. It is conceded that America leads the world in the manufacture of shoes, principally on account of superior style and workmanship; and the American last and pattern makers are entitled to a large degree of credit in establishing the character and style of the American shoe.

Methods of manufacture.—The following gives a fair idea of how a pair of shoes is turned out under modern methods in the factory of to-day: First, the cutters are given tickets describing the style of shoe required, the thickness of sole, and whatever other details are necessary. From this ticket the vamp cutter blocks out the vamps and gives them with the ticket to the upper cutter, who shapes the vamps to the pattern and cuts the tops or quarters which accompany them. The trimming cutter then gets out the side linings, stays, facings, or whatever trimmings are needed. The whole is then made into a bundle and sent to the fitting department. Here they are arranged in classes by themselves. Pieces which are too heavy are run through a splitting machine, and the edges are beveled by means of the skiving machine. Next they are pasted together, care being taken to join them at the marks made for that purpose. After being dried they go into the hands of the machine operators. The different parts go to different machines, each of which is adjusted for its particular work. The completed upper next goes to the sole-leather room, in which department machinery also performs the major part of the work. By the use of the cutting machine the sides of leather are reduced into strips corresponding to the length of the sole required. These strips are passed through a powerful rolling machine, which hardens the leather and removes from its surface all irregularities. They are then shaved down to a uniform thickness, also by machinery, and placed under dies which cut them out in proper form. The smaller pieces are died out in the form of lifts, or heel pieces, which are joined together to the proper thickness and cemented, after which they are put in presses which give them the greatest amount of solidity. The top lift is not added to the heel until after it has been nailed to the shoe. The remaining sole leather is used for shank pieces, rands, and bottom leveling.

For the insole, a lighter grade of leather is used, which, being cut into strips and rolled, is cut by dies to the correct shape, shaved uniformly, and channeled around the under edge for receiving the upper. The counters are died out and skived, by machine, and the welts cut in strips. The uppers and soles are then sent to the bottoming department, where the first operation is that of lasting, the uppers being tacked to the insole. From the laster they go to the machine operator, where the upper, sole, and welt are firmly sewed together by the machine. The bottom is filled and leveled off and the steel shank inserted. Next, the bottom is coated with cement, and the outsole pressed on it by a machine. Thence it is sent through the rounding machine, which trims it and channels the sole for stitching. From there it goes again to the sewing machine, which stitches through the welt outside of the upper. The next step is that of leveling, then heeling, both of which processes are accomplished by machinery. The heels are nailed on in the rough and afterwards trimmed into shape by a machine operating revolving knives; a breasting machine shaping the front of the heel. Still another machine drives in the brass nails and cuts them off flush with the top pieces. The edging machine is next used, which trims the edges of both sole and heel. The sole bottom is then sandpapered, blacked, and burnished by machinery, after which the shoe is cleaned, treed, and packed.[1]

The total floor space occupied by the shoe factories of the United States is practically 24,000,000 square feet, or about 550 acres.

The statistics of boot and shoe manufacture furnish an interesting commentary upon American enterprise, showing, as they do, the evolution of an industry from the smallest beginning and with the crudest appliances to a position that up to recent years equaled in importance that of any of the great industries of the country.

---

TABLE 10.—BOOTS AND SHOES:

		Nebraska.	New Hampshire.	New Jersey.	New York.	North Carolina.
1	Number of establishments	3	67	84	223	3
	Character of organization:					
2	Individual		18	36	111	1
3	Firm and limited partnership	3	30	23	68	
4	Incorporated company		19	25	44	2
5	Miscellaneous					
	Capital:					
6	Total	$43,500	$8,123,481	$3,153,255	$11,983,239	$37,700
7	Land	$1,000	$124,187	$68,655	$285,835	$200
8	Buildings	$9,000	$473,961	$296,541	$623,594	$1,850
9	Machinery, tools, and implements	$8,700	$1,063,569	$736,375	$2,362,396	$7,450
10	Cash and sundries	$24,800	$6,461,764	$2,051,684	$8,711,414	$28,200
11	Proprietors and firm members	6	86	86	264	1
	Salaried officials, clerks, etc.:					
12	Total number	6	362	333	1,076	3
13	Total salaries	$3,300	$357,046	$368,968	$1,018,153	$1,618
	Officers of corporations:					
14	Number		25	40	82	2
15	Salaries		$54,776	$93,432	$139,983	$918
	General superintendents, managers, clerks, etc.—					
16	Total number	6	337	293	994	1
17	Total salaries	$3,300	$302,270	$275,536	$878,170	$700
	Men—					
18	Number	6	237	241	811	1
19	Salaries	$3,300	$259,687	$252,173	$802,984	$700
	Women—					
20	Number		100	52	183	
21	Salaries		$42,583	$23,363	$75,186	
	Wage-earners, including pieceworkers, and total wages:					
22	Greatest number employed at any one time during the year	121	14,014	5,354	18,143	45
23	Least number employed at any one time during the year	33	9,874	3,958	13,398	45
24	Average number	65	12,007	4,421	15,796	40
25	Wages	$17,302	$4,971,954	$1,723,159	$6,138,653	$14,107
	Men, 16 years and over—					
26	Average number	18	7,756	2,740	9,754	40
27	Wages	$8,812	$3,540,273	$1,259,819	$4,465,363	$14,107
	Women, 16 years and over—					
28	Average number	37	3,866	1,497	5,483	
29	Wages	$8,490	$1,334,143	$427,732	$1,584,992	
	Children, under 16 years—					
30	Average number		386	184	559	
31	Wages		$97,538	$35,608	$88,298	
	Average number of wage-earners, including pieceworkers, employed during each month:					
	Men, 16 years and over—					
32	January	9	8,014	2,610	9,675	45
33	February	9	8,089	2,928	10,023	45
34	March	9	8,187	2,971	10,187	31
35	April	11	7,816	2,974	9,882	31

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 222. WASHINGTON, D. C. July 2, 1902.

AGRICULTURE.

UTAH.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

SIR: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the state of Utah, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It includes also the house in which the farmer resides and all other buildings used by him in connection with his farming operations.

The farms of Utah, June 1, 1900, numbered 19,387, and were valued at $50,778,350. Of this amount $10,651,790, or 21.0 per cent, represents the value of buildings, and $40,126,560, or 79.0 per cent, the value of the land and improvements other than buildings. On the same date the value of farm implements and machinery was $2,922,550, and of live stock $21,474,241. These values, added to that of farms, give $75,175,141, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of all such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $16,502,051, of which amount $8,259,080, or 50.0 per cent, represents the value of animal products, and $8,242,971, or 50.0 per cent, the value of crops, including forest products cut or produced on farms. The "total value of farm products" for 1899 exceeds that for 1889 by $11,610,591, or 237.4 per cent, but a part of this gain is due to a more detailed enumeration in 1900 than in 1890.

The "gross farm income" is obtained by deducting from the total value of farm products the value of the products fed to live stock on the farms of the producers. In 1899 the reported value of products fed was $2,959,390, leaving $13,542,661 as the gross farm income for that year. The percentage which this amount is of the "total value of farm property" is referred to in this bulletin as the "percentage of gross income upon investment." For Utah in 1899 it was 18.0 per cent.

As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

Special reports as to the dimensions and cost of the leading irrigation ditches and canals, the area of land under them, methods for the artificial application of water to the growing crops, and other facts relating to irrigation were obtained by correspondence with farmers, engineers, and others. This correspondence was under the joint direction of Mr. F. H. Newell, chief hydrographer of the Geological Survey, acting as expert special agent for the division of agriculture, and Mr. Clarence J. Blanchard.

The statistics presented in this bulletin will be treated in greater detail in the final report on agriculture in the United States. The present publication is designed to present a summarized advance statement for Utah.

Very respectfully,

L. G. Powers.
Chief Statistician for Agriculture.

AGRICULTURE IN UTAH.

GENERAL STATISTICS.

The total land area of Utah is 82,190 square miles, or 52,601,600 acres, of which 4,116,951 acres, or 7.8 per cent, are included in farms.

Utah belongs to the great plateau of the Rocky Mountains, its valleys being 2,700 feet above sea level and its mountain peaks reaching a height of from 12,000 to 15,000 feet.

East of the Wasatch Mountains, which bisect the state from north to south, the land is high and rocky, cut into canyons and gorges, and drained by rivers and mountain streams, which, with the exception of the Green and the Grand that unite to form the headwaters of the Colorado River, only attain volume and strength during the spring thaws.

West of the mountains is a succession of small valleys, and the drainage is into sinks and lakes which have no outlet, the largest of these being the Great Salt Lake.

The soil of the mountains and more elevated valleys is hard, clayey, and generally poor, but produces succulent grasses which furnish good ranges for live stock. In the lower parts the soil is sedimentary and not difficult of reclamation. Agriculture, however, is almost entirely dependent upon irrigation, the rainfall being slight and uncertain.

NUMBER AND SIZE OF FARMS.

The following table gives, by decades since 1850, the total and average acreage, and the per cent of farm land improved.

Table 1.—FARMS AND FARM ACREAGE: 1850 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS. Total.	Improved.	Unimproved.	Average.	Per cent of farm land improved.
1900	19,387	4,116,951	1,032,117	3,084,834	212.4	25.1
1890	10,517	1,323,705	548,223	775,482	125.9	41.4
1880	9,452	655,524	416,105	239,419	69.3	63.5
1870	4,908	148,361	118,755	29,606	30.2	80.0
1860	3,635	89,911	77,219	12,692	24.7	85.9
1850	926	46,849	16,333	30,516	50.6	34.9

The number of farms in Utah in 1900 was more than twenty times as great as in 1850, and 84.3 per cent greater than in 1890. The total farm area has also increased very rapidly, the rate of gain for the last decade being 211.0 per cent. The large increase in farm area is due to the extensive additions to private ranges from land formerly embraced in the public domain. This has led to an increase in the average size of farms and, as most of the new land is unimproved, a corresponding decrease is shown in the per cent of farm land improved. The actual area improved has increased rapidly, nearly doubling in the last decade.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1850.

Table 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND OF FARM PRODUCTS: 1850 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$75,175,141	$50,778,350	$2,922,550	$21,474,241	$16,502,051
1890	36,381,270	28,402,780	1,164,660	[2] 6,813,830	4,891,460
1880	18,268,569	14,015,178	946,753	[2] 3,306,638	3,337,410
1870 [3]	4,739,126	2,297,922	291,390	2,149,814	[4] 1,973,142
1860	3,092,951	1,333,355	242,889	1,516,707	....
1850	943,055	311,799	84,288	546,968	....

[1] For year preceding that designated.
[2] Exclusive of the value of animals on ranges.
[3] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other years they must be diminished by one-fifth.
[4] Includes betterments and additions to live stock.

Since 1850 the total value of farm property has increased $74,232,086, and in the last decade $38,793,871, or 106.6 per cent. The gain in value of land, improvements, and buildings between 1890 and 1900 was $22,375,570, or 78.8 per cent; in that of implements and machinery, $1,757,890, or 150.9 per cent; and in that of live stock, $14,660,411, or 215.2 per cent. The value of farm products in 1899 was 237.4 per cent greater than in 1889, but a portion of this increase is doubtless the result of a more detailed enumeration in 1900 than formerly. The most important item which was enumerated in 1900, but not in 1890 is the value of animals sold and animals slaughtered on farms, which amounted, for 1899, to $3,354,873, or 28.9 per cent of the increase.

COUNTY STATISTICS.

Table 3 gives a summary of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS, AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH VALUE OF PRODUCTS OF 1899 NOT FED TO LIVE STOCK, AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Value of products not fed to live stock.	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.

[1] Indian reservation.

In all counties the number of farms increased in the last ten years, and about one-third of the counties report more than twice as many farms. The total acreage in farm land increased to over three times that reported in 1890, and the improved area also shows a substantial increase, every county contributing to these gains. The average size of farms for the state is 212.4 acres, and varies from 45.9 acres in Washington county to 608.8 acres in Uinta county. In general the northern counties report the largest farms.

There was a marked increase in the value of farms in all counties in the last decade. In 1900 the average value of farms was $2,619. The northwestern counties report the highest values, but in no county does the average per farm fall below $1,000.

A general increase is reported in the value of implements and machinery. The total value of live stock was over three times as great in 1900 as in 1890, and averaged $1,108 per farm. In all except three counties the value reported in 1900 was more than twice as great as that in 1890.

FARM TENURE.

Table 4 gives a comparative statement of farm tenure for 1880, 1890, and 1900. The farms operated by tenants are divided into two groups, designated as farms operated by "cash tenants," who pay a rental in cash or a stated amount of labor or farm products, and "share tenants," who pay as rental a stated share of the products.

In Table 5 the tenure of farms for 1900 is given by race of farmer. The farms under the classification "owner" are subdivided into four groups, designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it, and the other or others owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive for their supervision and other services a fixed salary from the owners.

TABLE 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 TO 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.
1900	19,387	17,674	506	1,207	91.2	2.6	6.2
1890	10,517	9,974	121	422	94.8	1.2	4.0
1880	9,452	9,019	60	373	95.4	0.6	4.0

[1] Including "part owners," "owners and tenants," and "managers."

TABLE 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

PART 1.—NUMBER OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	19,387	15,177	2,051	135	311	506	1,207
White	19,144	14,979	2,045	135	311	472	1,202
Colored	243	198	6	....	....	34	5
Chinese	33	....	....	....	....	33	....
Indian	199	190	6	....	....	....	3
Negro	11	8	....	....	....	1	2

PART 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	100.0	78.3	10.6	0.7	1.6	2.6	6.2
White	100.0	78.2	10.7	0.7	1.6	2.5	6.3
Colored	100.0	81.5	2.5	....	....	14.0	2.0

In the period from 1880 to 1900 the total number of farms increased 105.1 per cent, the greater part of the increase having occurred in the last decade. Since 1890 the number of farms operated by owners has increased 7,700, or 77.2 per cent; by cash tenants, 385, or 318.2 per cent; and by share tenants, 785, or 186.0 per cent. The percentages in Table 4 show that the number of farms operated by owners has not increased as rapidly during the last decade as the number operated by tenants.

In 1900, 98.7 per cent of all farms were operated by white farmers and 1.3 per cent by colored farmers. Of the white farmers 89.6 per cent own all or a part of the farms they operate, and 10.4 per cent operate farms owned by others. The corresponding percentages for colored farmers are 84.0 and 16.0. The Indians, who comprise the greater part of the colored farmers, generally own the farms they operate, as do 8 of the 11 negro farmers, while all the Chinese farmers are cash tenants.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," and "managers," but it is believed that the number conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

TABLE 6.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.

Managers	7,417	1,012	391	10,737	4,956	25.3
Cash tenants	3,516	444	122	799	886	18.2
Share tenants	2,147	461	126	531	506	15.5

The average area, the average value of property and products, and the per cent of gross income are higher for white than for colored farmers, with the exception of the average and per cent of gross income for farms operated by Chinese farmers. Most of the last group report intensively cultivated vegetable farms.

The farms of managers show the highest average value of property, and the highest average and per cent of gross income. Most of these farms are devoted to live stock or grain.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	19,387	212.4	4,116,951	100.0	$75,175,141	100.0
Under 3 acres	595	2.5	1,487	(1)	2,512,763	3.3
3 to 9 acres	1,407	5.9	8,258	0.2	2,082,224	2.8
10 to 19 acres	2,202	14.1	30,987	0.8	4,138,535	5.5
20 to 49 acres	5,261	32.9	173,303	4.2	13,483,291	17.9
50 to 99 acres	3,741	71.9	268,889	6.5	13,232,924	17.6
100 to 174 acres	3,363	142.7	480,041	11.7	12,486,808	16.6
175 to 259 acres	1,194	212.7	254,021	6.2	6,163,802	8.2
260 to 499 acres	1,008	346.3	349,074	8.5	7,351,851	9.8
500 to 999 acres	368	663.8	244,291	5.9	4,323,194	5.8
1,000 acres and over	248	9,300.8	2,306,600	56.0	9,399,749	12.5

[1] Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock.)	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$2,070	$549	$151	$1,108	$698	18.0
Under 3 acres	313	254	63	3,593	1,473	34.9
3 to 9 acres	691	390	68	331	306	20.7
10 to 19 acres	1,038	424	87	330	324	17.2
20 to 49 acres	1,470	488	121	484	389	15.2
50 to 99 acres	2,047	576	152	762	502	14.2
100 to 174 acres	2,031	519	164	999	690	18.6
175 to 259 acres	2,860	717	204	1,381	926	17.9
260 to 499 acres	4,022	832	282	2,158	1,283	17.6
500 to 999 acres	6,096	1,145	343	4,164	2,491	21.3
1,000 acres and over	19,152	1,755	759	16,236	7,929	20.9

The group of farms containing from 20 to 49 acres each comprises a greater part of the total number of farms than any other. The group "1,000 acres and over" contains more than one-half of the total acreage, but only 12.5 per cent of the total value of farm property.

With few exceptions, the average values of the several forms of farm property and products increase with the size of the farms. The high average value of live stock for farms under 3 acres and the large gross income for the same class are due to the fact that most of them are ranges consisting almost entirely of public lands. Some of them are city dairies and market gardens. The incomes from these industries are determined not so much by the acreage of land used, as by the capital invested in buildings, implements, and live stock, and the amounts expended for labor and similar items.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading features of the statistics relating to farms classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop and constitutes at least 40.0 per cent of the value of the products not fed to live stock, the farm is designated as a "hay and grain" farm. If vegetables are the leading crop, constituting 40.0 per cent of the value of products, the farm is designated a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive their principal income from any one class of farm products. Farms with no income in 1899 are classified according to the agricultural operations upon other farms in the same locality.

TABLE 10.—NUMBER AND ACREAGE OF FARMS AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	19,387	212.4	4,116,951	100.0	$75,175,141	100.0
Hay and grain	6,857	172.3	1,181,514	28.7	23,372,694	31.1
Vegetables	729	43.7	31,833	0.8	2,035,087	2.7
Fruits	412	36.7	15,116	0.4	1,228,871	1.6
Live stock	5,458	453.5	2,475,256	60.1	32,633,667	43.4
Dairy produce	1,815	88.0	159,773	3.9	4,928,736	6.6
Sugar	440	38.1	16,771	0.4	1,221,282	1.6
Flowers and plants	20	2.2	44	(1)	80,960	0.1
Nursery products	17	58.5	995	(1)	137,500	0.2
Miscellaneous	3,639	64.8	235,649	5.7	9,536,344	12.7

[1] Less than one-tenth of 1 per cent.

TABLE 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$2,070	$549	$151	$1,108	$698	18.0
Hay and grain	2,296	539	159	415	527	15.5
Vegetables	1,833	604	102	253	565	20.2
Fruits	2,041	584	113	245	641	21.5
Live stock	2,298	592	177	2,912	1,196	20.0
Dairy produce	1,506	535	125	550	401	14.8
Sugar	1,845	512	124	295	601	21.7
Flowers and plants	2,213	1,670	120	45	1,690	41.8
Nursery products	6,386	1,097	337	268	7,178	88.8
Miscellaneous	1,641	493	125	362	433	16.5

For the several classes of farms the average value per acre of products not fed to live stock are as follows: For farms deriving their principal income from flowers and plants, $768.23; nursery products, $122.65; fruits, $17.46; sugar, $15.77; vegetables, $12.94; miscellaneous, $6.69; dairy produce, $4.56; hay and grain, $3.06; and live stock, $2.64. The wide variations in the averages and percentages of gross income are largely due to the fact that in computing gross income no deductions are made for expenses involved in operation. For florists' establishments and nurseries the average expenditures for such items as labor and fertilizers represent a far greater percentage of the gross income than for "live-stock" and "miscellaneous" farms. If it were possible to present the average net income, the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by the reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	19,387	212.4	4,116,951	100.0	$75,175,141	100.0
$0	230	91.2	20,987	0.5	453,510	0.6
$1 to $49	466	60.9	28,393	0.7	454,900	0.6

TABLE 13.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$2,070	$549	$151	$1,108	$698	18.0
$0	614	108	40	1,210	....	....
$1 to $49	557	197	56	166	29	3.0
$50 to $99	730	280	64	198	70	5.5
$100 to $249	931	349	86	266	169	10.4
$250 to $499	1,503	467	128	385	355	14.3
$500 to $999	2,420	651	175	692	680	17.3
$1,000 to $2,499	4,062	948	252	2,031	1,427	19.6
$2,500 and over	8,202	1,303	468	12,441	5,637	25.1

That many of the farms were homesteads taken up too late for cultivation that year is indicated by the fact that of the 230 farms of the state reporting no income for 1899, 204 were operated by owners and 53 were of 100 to 175 acres in size. There were some farms also from which no reports of the products of 1899 could be secured, as the persons in charge June 1, 1900, did not operate the farms the preceding year, and could give no information concerning the products of that year. To this extent the reports fall short of giving a complete report of farm products in 1899.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the census of 1900. The age grouping of neat cattle was determined by their present and prospective relations to the dairy industry and the supply of meat products. Horses and mules are classified by age and neat cattle and sheep by age and sex. The new classification permits a very close comparison with the figures published in previous census reports.

Table 14 presents a summary of live-stock statistics.

TABLE 14.—DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS AND RANGES, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age, in years.	ON FARMS AND RANGES.			NOT ON FARMS OR RANGES
		Number.	Value.	Average value.	Number.
Calves	Under 1	78,940	$729,551	$9.24	2,592
Steers	1 and under 2	32,505	544,555	16.75	379
Steers	2 and under 3	17,512	413,679	23.62	121
Steers	3 and over	6,073	174,487	28.73	104
Bulls	1 and over	5,445	219,312	40.28	73
Heifers	1 and under 2	40,461	681,040	16.83	732
Cows kept for milk	2 and over	65,905	2,037,367	30.91	8,379
Cows and heifers not kept for milk.	2 and over	96,849	2,352,853	24.29	551
Colts	Under 1	11,395	122,843	10.78	277
Horses	1 and under 2	13,515	247,348	18.30	287
Horses	2 and over	90,974	3,026,122	33.26	12,438
Mule colts	Under 1	458	6,279	13.71	15
Mules	1 and under 2	380	9,775	25.72	20
Mules	2 and over	1,278	42,796	33.49	126
Asses and burros	All ages	888	15 555	17.52	39
Lambs	Under 1	1,265,289	2,318,866	1.83	513
Sheep (ewes)	1 and over	1,893,802	5,695,818	3.01	2,509
Sheep (rams and wethers).	1 and over	659,332	2,241,804	3.40	393
Swine	All ages	65,732	293,115	4.46	6,036
Goats	All ages	1,427	2,702	1.89	42
Fowls:[1]					
Chickens[2]	....	534,842	186,922	....	....
Turkeys	....	10,649			
Geese	....	2,759			
Ducks	....	8,503			
Bees (swarms of)	....	33,818	111,452	3.30	....
Value of all live stock.	....	....	21,474,241	....	....

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.
[2] Including Guinea fowls.

The total value of all live stock on farms and ranges, June 1, 1900, was $21,474,241, of which 47.8 per cent represents the value of sheep, 23.8 per cent the value of neat cattle other than dairy cows, 15.8 per cent the value of horses, 9.5 per cent that of dairy cows, and 3.1 per cent that of all other live stock.

No reports were secured of the value of live stock not on farms or ranges, but it is probable that such animals have higher average values than those on farms. Allowing the same average value, however, the total value of the domestic animals not on farms or ranges is $788,159. Exclusive of poultry and bees not on farms the total value of live stock in the state is approximately $22,262,400.

CHANGES IN LIVE STOCK KEPT ON FARMS AND RANGES.

The following table shows the changes since 1860 in the numbers of the most important domestic animals.

TABLE 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS AND RANGES: 1850 TO 1900.

YEAR.	Dairy Cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	65,905	277,785	115,884	3,004	2,553,134	65,732
1890[2]	45,982	154,284	65,057	1,554	1,014,176	27,046
1880[2]	32,768	62,648	38,131	2,898	233,121	17,198
1870	17,563	21,617	11,068	2,879	59,672	3,150
1860	11,967	22,127	4,565	851	37,332	6,707
1850	4,861	7,755	2,429	325	3,262	914

[1] Lambs not included.
[2] Exclusive of animals on ranges.

The live-stock enumerations in 1880 and in 1890 did not include domestic animals on ranges, and hence the figures for those years presented in the table are not strictly comparable with the figures for 1900. The number of animals on ranges in 1890 was estimated by special agents to be as follows: All neat cattle, 78,047; horses, 22,243; sheep, 922,730. In comparing the number of animals reported in 1900 with the number reported in 1890 these estimates are disregarded. Nearly fourteen times as many dairy cows were reported in 1900 as in 1850, the gain in the last decade being 43.3 per cent. Nearly thirty-six times as many other neat cattle were reported in 1900 as in 1850, the gain since 1890 being 80.0 per cent. Horses have increased nearly fiftyfold since 1850 and 78.1 per cent since 1890. Nine times as many mules were kept in 1900 as in 1850, the increase in the last decade being 93.3 per cent. No other class of animals shows so great a numerical change as sheep, the rate of gain since 1890 being 151.7 per cent. Swine show large increases from decade to decade. Nearly ten times as many were reported in 1900 as in 1860, the gain in the last ten years being 143.0 per cent.

In comparing the poultry report of 1900 with that of the Eleventh Census, it should be borne in mind that in 1900 the enumerators were instructed not to report fowls less than three months old, while in 1890 no such limitation was made. Notwithstanding this fact, poultry of all kinds show increases since 1890, as follows: Chickens, 91.3 per cent; all other poultry, 33.4 per cent.

ANIMAL PRODUCTS.

Table 16 is a summarized statement of the animal products of 1899.

TABLE 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	17,050,977	$2,599,638
Mohair and goat hair	Pounds	459	142
Milk	Gallons	[1] 25,124,642	[2] 1,522,932
Butter	Pounds	2,812,122	
Cheese	Pounds	169,251	
Eggs	Dozens	3,387,340	424,628
Poultry			262,503
Honey	Pounds	1,292,118	94,364
Wax	Pounds	23,740	
Animals sold			2,695,504
Animals slaughtered			659,369
Total			8,259,080

[1] Comprises all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of all milk sold or consumed and of butter and cheese made.

The value of the animal products in 1899 was $8,259,080, or 50.0 per cent of the value of all farm products, and 61.0 per cent of the gross farm income. Of the total value given, 40.6 per cent represents the value of animals sold and animals slaughtered on farms; 31.5 per cent the value of wool, mohair and goat hair; 18.4 per cent the value of dairy products; 8.3 per cent the value of poultry and eggs; and 1.2 per cent that of honey and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

The operators of 9,895 farms, or 52.5 per cent of all having domestic animals, report sales of live stock on farms. The average value per farm of live animals sold was $272.41, and the average value per farm of animals slaughtered was $49.32. In securing the reports of sales of live animals the enumerators were instructed to obtain from each farm operator a statement of the amount received from sales in 1899, less the amount paid for animals purchased the same year.

DAIRY PRODUCTS.

The progress of dairying corresponds with that of other branches of agriculture. In the last ten years the production of milk has increased 191.6 per cent; that of butter made on farms, 59.8 per cent; that of cheese made on farms, 3.5 per cent.

Of the $1,522,932 given in Table 16 as the value of dairy products in 1899, $875,746, or 57.5 per cent, represents dairy products sold, and $647,186, or 42.5 per cent, that of dairy products consumed on farms. Of the former amount, $645,550 was received from the sale of 9,964,903 gallons of milk; $3,013 from 3,312 gallons of cream; $214,910, from 1,125,377 pounds of butter; and $12,273, from 122,933 pounds of cheese.

POULTRY AND EGGS.

The total value of the products of the poultry industry in 1899 was $687,131, of which amount 61.8 per cent represents the value of eggs produced, and 38.2 per cent the value of fowls raised. In 1899, 3,387,340 dozen eggs were produced, three times as many as ten years before.

WOOL.

For half a century the production of wool has increased rapidly. By the Twelfth Census 17,050,977 pounds were reported, nearly four times as much as in 1890, but a part of this increase is probably only apparent, as the fleeces of a large number of sheep were omitted from the table in 1890, but included in a general estimate of wool shorn after the census enumeration. The average weight of the fleeces increased from 5.0 pounds in 1890 to 6.4 pounds in 1900, indicating improvement in the grade of sheep kept. Wool growing is a leading industry throughout the state, as the dry climate keeps the sheep in good health and improves the texture and cleanliness of the wool. San Pete county shows the greatest production in both 1890 and 1900, but Grand county shows the greatest increase.

HONEY AND WAX.

The quantity of honey produced in 1899 was 1,292,118 pounds, nearly three times the product of 1889. The quantity of wax reported in 1899 was 23,740 pounds, while in 1889 it was but 11,708 pounds.

HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses and dairy cows, the total number of these animals, and the average number per farm. In computing the averages presented, only those farms which report the kind of stock under consideration are included.

TABLE 17.—HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.			DAIRY COWS.		
	Farms reporting.	Number.	Average per farm.	Farms reporting.	Number.	Average per farm.
Total	17,806	115,884	6.5	16,581	65,905	4.0
White farmers	17,581	109,907	6.3	16,562	65,838	4.0
Colored farmers	225	5,977	26.6	19	67	3.5
Owners[1]	16,104	100,473	6.2	15,128	60,218	4.0
Managers	265	7,029	26.5	173	930	5.4

[1] Including "part owners" and "owners and tenants."
[2] Including florists' establishments and nurseries, and tobacco, cotton, and rice farms.

CROPS.

The following table gives the statistics of the principal crops grown in 1899:

TABLE 18.—ACREAGES, QUANTITIES, AND VALUES OF THE PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantity.	Value.
Corn	11,517	Bushels	250,020	$121,872
Wheat	189,235	Bushels	3,413,470	1,575,064
Oats	43,394	Bushels	1,436,225	553,847
Barley	8,644	Bushels	252,140	121,826
Rye	2,866	Bushels	28,630	13,761
Buckwheat	43	Bushels	640	419
Flaxseed	1	Bushels	20	40
Clover seed		Bushels	35,328	127,901
Grass seed		Bushels	39	87
Hay and forage	388,043	Tons	851,864	3,862,820
Cotton	10	Bales	5	250
Cotton seed		Tons	2	12
Broom corn	19	Pounds	4,830	259
Peanuts	2	Bushels	151	73
Dry beans	176	Bushels	1,806	4,085
Dry pease	143	Bushels	2,694	3,504
Potatoes	10,433	Bushels	1,483,570	487,816
Sweet potatoes	40	Bushels	4,958	1,635
Onions	175	Bushels	53,440	33,317
Miscellaneous vegetables	5,848			362,782
Sorghum cane	371	Tons	101	442
Sorghum sirup		Gallons	28,017	12,993
Sugar beets	7,546	Tons	85,914	365,163
Small fruits	1,052			117,489
Orchard fruits	[1]16,013	Bushels		[2]263,098
Grapes	[1]446	Centals	9,200	[3]27,736
Figs	[1]7	Pounds	5,425	190
Nuts				878
Forest products				13,311
Flowers and plants	14			34,173
Seeds	84			10,330
Nursery products	236			120,648
Miscellaneous	16			[4]5,150
Total	686,374			8,242,971

[1] Estimated from number of vines or trees.
[2] Including value of cider, vinegar, etc.
[3] Including value of wine, raisins, etc.
[4] The greater part of this value was derived from products for which no acreage was reported.

Of the total value of crops, hay and forage contributed 46.9 per cent; cereals, 29.0 per cent; potatoes, 5.9 per cent; fruits and nuts, 5.0 per cent; vegetables, including sweet potatoes and onions, 4.8 per cent; sugar beets, 4.4 per cent; and all other crops, 4.0 per cent.

The average values per acre of, the various crops are as follows: Flowers and plants, $2,441; nursery products, $511; onions, $190; seeds, $123; small fruits, $112; grapes, $62; miscellaneous vegetables, $62; sugar beets, $48; potatoes, $47; orchard fruits, $16; hay and forage, $10; and cereals, $9. The crops yielding the highest average returns per acre were grown upon highly improved land. Their production requires a relatively great amount of labor and large expenditures for fertilizers.

CEREALS.

The following table is a statement of the changes in cereal production since 1849.

TABLE 19.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899.

PART 1.—ACREAGE.

YEAR.[1]	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	8,644	43	11,517	43,394	2,866	189,235
1889	6,440	15	5,782	22,747	3,389	84,505
1879	11,268		12,007	19,525	1,153	72,542

[1] No statistics of acreage were secured prior to 1879.

TABLE 19.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899—Continued.

PART 2.—BUSHELS PRODUCED.

YEAR.[1]	Barley.	Buck-wheat.	Corn.	Oats.	Rye.	Wheat.
1899	252,140	640	250,020	1,436,225	28,630	3,413,470
1889	163,328	316	84,760	597,947	33,928	1,515,465
1879	217,140	....	163,342	418,082	9,605	1,169,199
1869	49,117	178	95,557	65,650	1,312	558,473
1859	9,976	68	90,482	63,211	754	384,892
1849	1,799	332	9,899	10,900	210	107,702

[1] No statistics of acreage were secured prior to 1879.

The total area devoted to cereals in 1879 was 116,495 acres; in 1889, 122,878 acres; and in 1899, 255,699 acres. The acreages devoted to wheat and corn in 1899 were approximately twice as large, and that to buckwheat nearly three times as large as in 1889. The acreage under oats increased 90.8 per cent, that under barley increased 34.2 per cent, and that under rye decreased 15.4 per cent in the same period. The total production of cereals in 1849 was 130,842 bushels and that of 1899 was 5,381,125 bushels, or over 41 times as great.

Of the total area under cereals in 1899, 74.0 per cent was devoted to wheat, 17.0 per cent to oats, 4.5 per cent to corn, 3.4 per cent to barley, and 1.1 per cent to rye and to buckwheat.

HAY AND FORAGE.

In 1900, 17,042 farmers, or 87.9 per cent of the total number, reported hay and forage. Excluding cornstalks, they obtained an average yield of 2.2 tons per acre. The total area in hay and forage for 1899 was 388,043 acres, or 143.5 per cent greater than ten years before. Of this area, 268,229 acres, or 69.1 per cent, produced 681,515 tons of lucern or alfafa.

In 1899 the acreages and yields of the various other kinds of hay and forage were as follows: Wild, salt, and prairie grasses, 71,065 acres and 88,690 tons; millet and Hungarian grasses, 2,604 acres and 3,376 tons; clover, 1,357 acres and 2,995 tons; other tame and cultivated grasses, 38,999 acres and 66,587 tons; grains cut green for hay, 3,324 acres and 4,290 tons; crops grown for forage, 2,465 acres and 3,509 tons; and cornstalks, 603 acres and 902 tons.

In Table 18 the production of cornstalks is included under "hay and forage," but the acreage is a part of that given for corn, as this forage was only an incidental product of the corn crop.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 are shown in the following table.

TABLE 20.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900	1890	1899	1889
Apples	715,778	112,396	189,882	56,633
Apricots	27,927	6,473	5,272	4,178
Cherries	66,215	4,259	9,905	973
Peaches	409,665	68,121	85,315	69,910
Pears	229,310	9,564	59,982	6,198
Plums and prunes	298,808	23,027	45,984	9,663

In the decade from 1890 to 1900 great progress was made in fruit growing. Nearly seven times as many apple trees, over six times as many peach trees, almost thirteen times as many plum and prune trees, and almost twenty-four times as many pear trees were reported in 1900 as in 1890. The total number of trees increased from 223,840 to 1,786,412.

Of the number reported in 1900, 40.1 per cent were apple trees, 22.9 per cent peach trees, 16.7 per cent plum and prune trees, 12.8 per cent pear trees, 3.7 per cent cherry trees, 1.6 per cent apricot trees, and 2.2 per cent unclassified fruit trees. The last-named class, which is not given in the table, numbered 38,709, and yielded 1,523 bushels of fruit.

The northwestern counties of Weber, Salt Lake, Utah, and Boxelder report the greatest numbers of fruit trees, and Weber county alone contributed $100,179 of the $263,098, which was the total value of orchard products in 1899. In this total value is included the value of 439 barrels of cider, 194 barrels of vinegar, and 145,380 pounds of dried and evaporated fruits produced on farms.

VEGETABLES.

The value of vegetables grown in 1899, including potatoes, sweet potatoes, and onions, was $885,550. Of this amount, 55.1 per cent represents the value of potatoes and 3.8 per cent that of onions. Aside from the land devoted to potatoes, sweet potatoes, and onions, 5,848 acres were used in the growing of miscellaneous vegetables. Of this area the products of 3,139 acres were not reported in detail. Of the remaining 2,709 acres concerning which detailed reports were received, 1,318 acres were devoted to tomatoes, 380 to cabbages, 304 to watermelons, 181 to sweet corn, 113 to muskmelons, 97 to cucumbers, 84 to squashes, and 232 to other vegetables.

SMALL FRUITS.

The total area used in the cultivation of small fruits in 1899 was 1,052 acres, distributed among 4,003 farms. The value of the fruits grown was $117,489, an average of $29.35 per farm.

The acreage and production of the different berries were as follows: Strawberries, 345 acres and 663,190 quarts; raspberries and Logan berries, 284 acres and 426,000 quarts; currants, 194 acres and 304,850 quarts; gooseberries, 110 acres and 173,460 quarts; blackberries and dewberries, 72 acres and 80,110 quarts, and other small fruits, 47 acres and 47,120 quarts.

SUGAR BEETS.

The beet-sugar industry is an important branch of agriculture in Utah. In 1899, 1,753 farmers devoted to this crop an area of 7,546 acres, an average of 4.3 acres per farm. They obtained and sold 85,914 tons of beets, an average yield of 11.4 tons per acre, and received therefore $365,163, or an average of $208.31 per farm, $48.39 per acre, and $4.25 per ton. Utah, Weber, and Salt Lake counties report 88.7 per cent of the acreage, with a product valued at $340,290, or 93.2 per cent of the total receipts from this crop.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 14 acres, and the value of the products sold therefrom was $34,173. These flowers and plants were grown by 36 farmers and florists, of whom 20 made commercial floriculture their principal business. They had invested in land, buildings, implements, and live stock $80,960, of which $33,400 represents the value of buildings. Their sales of flowers and plants amounted to $32,922, and they obtained other products valued at $880. They expended $6,645 for labor, and $615 for fertilizers. The average income for each farm reporting, including products fed to live stock, was $1,695.

In addition to the 20 principal florists' establishments, 289 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 71,348 square feet, making, with the 79,672 square feet belonging to the florists' establishments, a total of 151,020 square feet of land under glass.

NURSERIES.

The total value of nursery products sold in 1899 was $120,648, reported by the operators of 47 farms and nurseries. Of this number 17 derived their principal income from the nursery business. They had 995 acres of land, valued at $108,565, buildings worth $18,650, implements and machinery worth $5,725, and live stock worth $4,560. The value of their products in 1899 was $122,035, of which $118,575 represents the value of nursery stock, and $3,460, that of other products. The expenditure for labor was $22,315, and for fertilizers, $515. The average income for each farm reporting, including products fed to live stock, was $7,222.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $1,837,900, an average of $95 per farm. The average expenditure was $1,313 for nurseries, $332 for florists' establishments, $198 for live-stock farms, $65 for hay and grain farms, $64 for sugar farms, $57 for fruit farms, and $39 for vegetable and for dairy farms. "Managers" expended on an average $1,238; "cash tenants," $94; "owners," $72; and "share tenants," $59. White farmers expended $96 per farm, and colored farmers $20.

Fertilizers purchased in 1899 cost $14,300, an average of $0.74 per farm, and a decrease since 1890 of 38.4 per cent. The average expenditure was $31 for florists' establishments, $30 for nurseries, and $2 for sugar farms; and hay and grain, vegetable, live stock, fruit, and dairy farms expended less than $1 each.

UINTA VALLEY AND UNCOMPAHGRE RESERVATIONS.

Uinta Valley and Uncompahgre reservations are located in the northeastern part of Utah, in Uinta and Wasatch counties. Uinta Valley reserve comprises an area of 3,186 square miles. Uncompahgre, with the exception of 20 square miles allotted to 83 Indians and a reserve of the mineral lands by the Government, has been opened up to settlement. The valleys of the Uinta river and its tributaries are fertile, well watered, and timbered. Agriculture is successful only through irrigation. Approximately one-tenth of the Uinta Valley reservation has a water supply sufficient to make it suitable for agriculture, but the remainder is well adapted to stock raising.

This is the home of the Uinta, White River, and Uncompahgre Ute, of Shoshonean stock, having a total population of 1,637. They have begun to realize that industry is essential to their existence, and their desire to become self-supporting is constantly increasing. Agriculture is their principal occupation, and a continual improvement is perceptible. A few raise stock, others find employment in freighting Government supplies and in cutting and hauling logs. The majority still live in the "tepee," although a few log huts have been constructed. The Uinta and White River bands are dependent upon Government rations for 60.0 per cent of their subsistence, and the Uncompahgre for but 45.0 per cent, while annuity payments provide 10.0 per cent of the sustenance of the entire number.

Alfalfa is the most extensive crop of the Utah Indians, while wheat and oats constituted their product of cereals. Many cultivated gardens in which they raised potatoes, onions, melons, pumpkins and turnips, while a few also reported pease, beans, cabbages, and sweet corn. The majority of the 131 Indian farmers had from

10 to 50 acres each under cultivation, but a few had over 100 acres, and their farms compared favorably with those of white farmers in the same vicinity. All crops were raised by the aid of irrigation, and their system is in fairly good condition. There is approximately 65 miles of ditch on the reserve, covering about 60,000 acres of land.

These Indians have not taken advantage of the opportunity for stock raising which their land affords, and although a number have undertaken the industry, their herds are not large enough as yet to yield profit to the owners. The Uncompahgre possess small flocks of sheep, but by far the larger number on the reserve are owned by white renters. Their horses consist largely of Indian ponies, and of these they have an excessive number.

IRRIGATION STATISTICS.

More than one-half of Utah belongs to the Great Basin, an ancient lake bed extending from the middle to the western portion of the state and across Nevada into California, where the lofty Sierras interpose—a barrier to the plain. On the eastern borders of the basin, the wall-like Wasatch range divides the state into two great parts, widely different in topography and climate. East of this range is an extension of the plateau region of the Colorado, similar in many respects to that of Arizona. The plateau culminates at the foot of the Uinta Mountains, a lofty range extending across the northern boundaries of the state. Its surface is deeply scored by the streams rising among the snow-clad peaks, and its configuration renders impossible the reclamation of extensive areas by irrigation.

The rivers for the most part of their courses flow across the plateau in deep canyons having precipitous sides, and it is only at points where they emerge in narrow valleys that the water can be utilized for irrigation. With the exception of a few favorable localities, the plateau region figures but slightly in the agricultural economy of the state. Its vast area is used only for grazing. All of the streams of the eastern slope of the Wasatch Mountains belong to the system of the Colorado of the West, and all of the precipitation not lost by evaporation finally reaches the Pacific Ocean.

The Great Basin has an elevation of from 4,000 to 6,000 feet above sea level, and is surrounded by mountains attaining altitudes of from 8,000 to 13,000 feet. It is a broad area of varied surface, containing many independent drainage districts. Within its boundaries are a number of mountain ridges of no great length, having a general northerly trend. Between these ranges are smooth valleys, the floors of which are built up of the débris washed from the mountains. Within the basin are several lofty plains areas which are called deserts. The largest are the Great Salt Lake and Carson deserts, on the north; and the Mojave and Colorado deserts, on the south. Of lesser importance are the Escalante, the Sevier, the Amargosa, and the Ralston deserts. The general slope of the Great Basin is toward the south, its surface at the lower end lying below that of the ocean. It is a region essentially arid, with markedly deficient rainfall.

A peculiar interest is attached to the Great Basin in Utah from the fact that it is the location of the first irrigation enterprise of considerable importance in the arid West by the Anglo-Saxons. In 1847 the Mormon pioneers turned the waters of City Creek upon the parched soil of Salt Lake Valley. These pioneers came from the Middle West, and were wholly unacquainted with irrigation. Their hardships were numerous and severe in the first years of their settlement. The development of agriculture and irrigation in this valley presents the best example of the value of coöperation in the construction of irrigation works and in the distribution of water. Agriculture by the Mormons was intensive, the tendency from the first being to restrict the areas and to establish small communities. Naturally, the scanty water supply influenced this form of farming in no slight degree. The valley in which the first settlement was made continues to hold first place in the state, in points of population, wealth, and agricultural development. More than one-third of the population resides in this section. In 1899 the value of the land and buildings was nearly 30 per cent, and the value of products more than 25 per cent of that reported for the whole state.

Comparing the agricultural development of the Great Basin with the Plateau region of the state, it is noted that nearly 90 per cent of the total area reclaimed belongs to the former; and of the total of 629,293 acres irrigated in 1899, only 65,889 acres are outside of the Great Basin. This acreage is widely distributed, being found in isolated tracts extending from Uinta county in the northeast to Washington county in the southwest.

Table A is an exhibit, by counties, of the number of irrigators and the acreage irrigated in 1899 and 1889, with percentages of increase.

Table A.—NUMBER OF IRRIGATORS AND ACRES IRRIGATED IN 1899 AND 1889, WITH PERCENTAGES OF INCREASE, BY COUNTIES.

[1] Exclusive of Indian reservations.
[2] Part of Emery taken to form Carbon in 1894.
[3] Wayne county formed from part of Piute in 1892.

During the ten years ending with 1899 the number of irrigators in the state, exclusive of Indian reservations, increased from 9,724 to 17,924, or 84.3 per cent, and the number of acres irrigated, from 263,473 to 629,293, or 138.8 per cent.

In Table B the number of irrigated farms is compared with the total number of farms, and the number of irrigated acres with the total number of improved acres.

Table B.—COMPARISON OF IRRIGATED FARMS WITH TOTAL NUMBER OF FARMS AND OF IRRIGATED ACREAGE WITH TOTAL IMPROVED ACREAGE, JUNE 1, 1900.

Weber	1,479	1,417	95.8	48,208	33,111	68.7

[1] 1899.

Of the total number of farms in the state, irrigation was practiced on 17,924, or 93.1 per cent. Of the total improved area, 1,027,226 acres, 629,293 acres, or 61.2 per cent, were irrigated during the year 1899.

In Table C is shown the acreage and production of all crops and of irrigated crops in 1899.

Table C.—ACREAGE AND PRODUCTION OF ALL CROPS AND OF IRRIGATED CROPS, 1899.

CROPS.	ACREAGE. Total.	Irrigated.	Per cent irrigated.	Unit of measure.	PRODUCTION. Total.	Irrigated.	Per cent irrigated.

[1] Not including area of "duplicate forage crops" (cornstalks and cornstrippings.)
[2] Including cornstalks and corn strippings.
[3] Amount sold.
[4] Estimated from number of vines or trees.

Of the 686,374 acres in crops, 537,588 acres, or 78.3 per cent, were irrigated. The crops produced on irrigated land were, hay and forage, 330,578 acres, or 61.5 per cent of the total; cereals, 165,969 acres, or 30.9 per cent; vegetables, 15,684 acres, or 2.9 per cent; orchard fruits, 16,013 acres, or 3.0 per cent; other crops, 9,344 acres, or 1.7 per cent. The value of irrigated crops was, total, $7,462,370; hay and forage, $3,654,114; cereals, $1,940,012; vegetables, $840,814; orchard fruits, $261,155; other crops, $766,275. The principal crops represented in the value of "other crops" were sugar beets, $365,163; flowers and nursery products, $164,977; grass seed, $114,238.

Of the total irrigated area, 624,186 acres were watered from streams by gravity diversion ditches and 5,177 acres were irrigated from wells. The total cost of construction of the well systems was $142,996.

In Table D is shown the principal statistics of irrigation from streams in 1899.

TABLE E.—ACREAGE IRRIGATED FROM STREAMS IN 1899, WITH NUMBER AND LENGTH OF DITCHES, AND COST OF IRRIGATION SYSTEMS SUPPLIED WITH WATER FROM STREAMS BY GRAVITY DIVERSION.

COUNTIES.	Number of ditches.	Length of ditches in miles.	Number of acres irrigated from streams.	COST OF CONSTRUCTION OF IRRIGATION SYSTEMS.

Weber	35	166	32,804	390,583	11.91

In 1899 there were operated 928 irrigation systems receiving water from streams by gravity diversion. The total cost of construction was $5,722,306, or an average cost per acre irrigated in 1889 of $9.17. Bear River canal system, which cost $1,250,000 and which was designed to irrigate 75,000 acres, is of comparatively recent construction, and in 1899 only 17,000 acres of the land under the system were irrigated. Exclusive of this system, the average cost of construction per acre irrigated was $7.37. The average cost of maintenance per acre for the state was $0.24. The total length of the main canals and ditches operated in 1899 was 2,838 miles.

The average value per acre of all farms, June 1, 1900, was $9.75, and of farms on which irrigation was practiced, $10.42. The average value per acre of irrigated land was $37.40.

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 223. WASHINGTON, D. C. July 2, 1902.

AGRICULTURE.

VIRGINIA.

Hon. WILLIAM R. MERRIAM,

Director of the Census.

SIR: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the state of Virginia, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land, under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It includes also the house in which the farmer resides, and all other buildings used by him in connection with his farming operations.

The farms of Virginia, June 1, 1900, numbered 167,886, and were valued at $271,578,200. Of this amount, $70,963,120, or 26.1 per cent, represents the value of buildings, and $200,615,080, or 73.9 per cent, the value of land and improvements other than buildings. On the same date the value of farm implements and machinery was $9,911,040, and of live stock, $42,026,737. These values, added to that of farms, give $323,515,977, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of all such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $86,548,545, of which amount $27,846,803, or 32.2 per cent, represents the value of animal products, and $58,701,742, or 67.8 per cent, the value of crops, including forest products cut or produced on farms. The "total value of farm products" for 1899 exceeds that for 1889 by $44,304,087, or 104.9 per cent.

The "gross farm income" is obtained by deducting from the total value of farm products the value of the products fed to live stock on the farms of the producers. In 1899 the reported value of products fed was $13,002,810, leaving $73,545,735 as the gross farm income for that year. The ratio which this amount bears to the "total value of farm property" is referred to in this bulletin as the "percentage of gross income upon investment." For Virginia, in 1899, it was 22.7 per cent.

As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

The statistics presented in this bulletin will be treated in greater detail in the final report on agriculture in the United States. The present publication is designed to present a summarized advance statement for Virginia.

Very respectfully,

L. G. Powers.

Chief Statistician for Agriculture.

GENERAL STATISTICS.

Virginia has a total land area of 40,125 square miles, or 25,680,000 acres, of which 19,907,883 acres, or 77.5 per cent, are included in farms.

The surface of the state is level in the southeast, and mountainous in the northwest and west, where it is traversed by the Blue Ridge and other ranges of the Appalachian Mountains. Extending westward from the Atlantic Ocean, the state is divided into six physical regions, known as Tidewater, Midland, Piedmont, Blue Ridge, Great Valley, and Appalachian, which rise in successive terraces, and, differing in altitude, soil, and products, have all the climatic variations of the temperate zone.

The soil is especially adapted to truck farming in the Tidewater and Midland, to tobacco in the south central portion of the state, and to orchard fruits, cereals, and grasses in the Piedmont and the Shenandoah Valley. Stock raising is an important and growing industry in the north central and western parts, where the blue grass flourishes. The Potomac, Rappahannock, York, James, and New rivers, together with their tributaries, afford excellent drainage.

NUMBER AND SIZE OF FARMS.

The following table gives, by decades since 1850, the number of farms, the total and average acreage, and the percentage of farm land improved.

TABLE 1.—FARMS AND FARM ACREAGE: 1850 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	167,886	19,907,883	10,094,805	9,813,078	118.6	50.7
1890	127,600	19,104,951	9,125,545	9,979,406	149.7	47.8
1880	118,517	19,835,785	8,510,113	11,325,672	167.4	42.9
1870	73,849	18,145,911	8,165,040	9,980,871	245.7	45.0
1860[1]	92,605	31,117,036	11,437,821	19,679,215	336.0	36.8
1850[1]	77,013	26,152,311	10,360,135	15,792,176	339.6	39.6

[1] Including the territory now embraced in West Virginia.

During the Civil War period one-third of Virginia was incorporated in the new state of West Virginia. The territory withdrawn contained 10,896,379 acres in farms, consisting of 2,346,127 acres of improved land and 8,550,252 acres of unimproved land, which should be considered in comparing the figures for the various census years. Making allowance for this reduction in area, the tables show a loss in total farm acreage during the decade, 1860 to 1870, of 2,074,746 acres, of which the state has recovered all but about 300,000 acres.

Between 1850 and 1900 the number of farms more than doubled, the decade from 1860 to 1870 being the only one reporting a decrease. During the last ten years there was a gain of 40,286 farms, or 31.6 per cent. The number of farms has increased faster than the total acreage, involving a decrease in the average size, which has been continuous since 1850.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1850.

TABLE 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND OF PRODUCTS: 1850 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$323,515,977	$271,578,200	$9,911,040	$42,026,737	$86,548,545
1890	294,488,569	254,490,600	6,593,688	33,404,281	42,244,458
1880	247,476,536	216,028,107	5,495,114	25,953,315	45,726,221
1870[2]	246,132,550	213,020,845	4,924,036	28,187,669	[3]51,774,801
1860[4]	428,957,006	371,761,661	9,392,296	47,803,049	....
1850[4]	257,079,974	216,401,543	7,021,772	33,656,659	....

[1] For year preceding that designated.
[2] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other years they must be diminished one-fifth.
[3] Includes betterments and additions to live stock.
[4] Including the territory now embraced in West Virginia.

Great development is shown for the decade from 1850 to 1860, but on account of the territorial change previously mentioned, the state lost territory whose farm property was valued in 1860 at $101,891,915, of which $87,526,087 represented the value of land, buildings, and improvements; $12,392,680, that of live stock; and $1,973,148, that of implements and machinery. Taking these deductions into consideration, the table shows that since 1860 there have been gains of $6,616,368 in the value of live stock, and $2,491,892 in the value of implements and machinery; but a decrease in the value of land, buildings, and improvements of $12,657,374. The total value of farm property is $3,549,114 less than in 1860.

In the last ten years the total value of farm property has increased $29,027,408, or 9.9 per cent; that of land, improvements, and buildings, $17,087,600, or 6.7 per cent; that of implements and machinery, $3,317,352, or 50.3 per cent; and that of live stock, $8,622,456, or 25.8 per cent. The value of farm products for 1899 is more than double that of ten years before. Part of this increase, and of that in implements and machinery, is doubtless the result of a more detailed enumeration in 1900 than heretofore.

COUNTY STATISTICS.

Table 3 gives a statement of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS, AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH GROSS INCOME (PRODUCTS OF 1899 NOT FED TO LIVE STOCK) AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Gross income (products of 1899 not fed to live stock).	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.
The State	167,886	164,074	19,907,883	10,094,805	$200,615,080	$70,963,120	$9,911,040	$42,026,737	$73,545,735	$7,790,720	$3,681,790

In the last decade the number of farms increased in all counties except Clarke, Montgomery, and Warwick. A decrease in the acreage of farm land is reported in less than one-fourth of the counties, while a smaller number show losses in the acreage of improved land. The decrease reported in improved area is due to a more intensive cultivation of smaller areas of farm land and to the use of a more strict definition of the term "improved land" by the Twelfth than by any preceding census. The average size of farms for the state is 118.6 acres, ranging from 30.0 acres in Mathews county to 325.5 acres in Bath county. The largest farms are found, as a rule, in the western counties, devoted to cereals and stock raising, and the smallest in the southeastern counties.

Between 1890 and 1900 the value of farms increased in three-fourths of the counties. The decreases reported are mainly in the southwestern counties. For the state the average value of farms, including land, improvements, and buildings, is $1,618. Nearly all counties report increases in the value of implements and machinery, and only five counties report decreases in the amounts invested in live stock.

The average amount paid per farm for labor in 1899 varied from less than $10 to more than $100, the former expenditure being reported from counties devoted mainly to dairying, and the latter, from a few western live-stock counties and some eastern counties containing numerous truck farms. The majority of counties, however, showed little variation from the state average. Clarke, Charles City, Rockingham, and Shenandoah counties alone reported a smaller expenditure for fertilizers in 1899 than in 1889.

FARM TENURE.

Table 4 gives a comparative statement of farm tenure for 1880, 1890, and 1900, showing the number and percentage of farms operated by owners and by tenants. Tenants are divided into two groups—"cash tenants," who pay a rental in cash or a stated amount of labor or farm produce, and "share tenants," who pay as rental a stated share of the products.

In Table 5 the tenure of farms in 1900 is given by race of farmer, and "farms operated by owners" are subdivided into groups designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it and the other or others owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive for their supervision and other services a fixed salary from the owners.

TABLE 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 TO 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.
1900	167,886	116,290	16,649	34,947	69.3	9.9	20.8
1890	127,600	93,311	11,985	22,304	73.1	9.4	17.5
1880	118,517	83,531	13,392	21,594	70.5	11.3	18.2

[1] Including "part owners," "owners and tenants," and "managers."

TABLE 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

PART 1.—NUMBER OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	167,886	102,269	10,382	1,504	2,135	16,649	34,947
White	123,052	79,460	6,759	1,370	1,897	9,758	23,808
Colored[1]	44,834	22,809	3,623	134	238	6,891	11,139

PART 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	100.0	60.9	6.2	0.9	1.3	9.9	20.8
White	100.0	64.6	5.5	1.1	1.5	7.9	19.4
Colored[1]	100.0	50.9	8.1	0.3	0.5	15.4	24.8

[1] Including 39 Indians.

In the period from 1880 to 1900 the total number of farms increased 41.7 per cent, and in the last decade, 31.6 per cent. Since 1890 the number of farms operated by owners has increased 24.6 per cent; by cash tenants, 38.9 per cent; and by share tenants, 56.7 per cent. The percentages in Table 4 indicate that the number of farms operated by owners has not increased so rapidly during the last ten years as the number of tenant farms.

In 1900, 73.3 per cent of the farms of the state were operated by white farmers and 26.7 per cent by colored farmers. Of the white farmers, 71.2 per cent own all or a part of the farms they operate, and 28.8 per cent operate farms owned by others. The corresponding percentages for colored farmers are 59.3 and 40.7.

In 1890, 35.0 per cent of all tenants were cash tenants, and in 1900, 32.3 per cent. This slight variation shows there has been little change in the relative proportions of the tenant classes.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the number conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

TABLE 6.—NUMBER AND ACREAGE OF FARMS AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	167,886	118.6	19,907,883	100.0	$323,515,977	100.0

[1] Includes 39 Indians.

TABLE 7.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY RACE OF FARMER AND BY TENURE.

RACE OF FARMER, AND TENURE.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$1,195	$423	$59	$250	$438	22.7
White	1,513	532	73	312	528	21.7
Colored[1]	323	123	21	80	192	35.0
Owners	1,220	477	66	274	451	22.1
Part owners	1,203	376	60	268	440	23.1
Owners and tenants	1,714	578	87	363	633	23.1
Managers	5,756	1,753	190	938	1,273	14.7
Cash tenants	1,046	292	41	171	381	24.6
Share tenants	887	253	37	168	367	27.3

[1] Includes 39 Indians.

The value of the farm property of colored farmers is $24,529,016, more than one-half the total number owning the farms they operate. With the exception of 39 Indians, the colored farmers of the state are negroes.

Farms operated by share tenants have the smallest average area, 101.9 acres, and those conducted by managers the largest, 369.4 acres. A number of the farms operated by managers are adjuncts of public institutions, while others are conducted for wealthy individuals in connection with their summer homes. These farms, as a rule, are favorably located and highly improved, and the average values of their several forms of farm property, shown in Table 7, are much larger than those of any other tenure group. The ratio which their gross income bears to the total value of their farm property is, however, smaller than for any other group. This is due to the high average valuation of the farm property and to the fact that some of these farms are not cultivated for profit. The high percentage of gross income shown for colored farmers is due to the smaller size and consequent more intensive cultivation of their farms, and the low value of their farm property, or capital invested. More than one-fourth of the farmers are colored, but the value of the farm property they operate is only 7.6 per cent of the total value for the state.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	167,886	118.6	19,907,883	100.0	$323,515,977	100.0
Under 3 acres	1,671	1.8	2,999	(1)	880,414	0.3
3 to 9 acres	12,898	5.9	75,504	0.4	5,456,122	1.7
10 to 19 acres	18,334	13.4	245,754	1.2	9,421,688	2.9
20 to 49 acres	35,644	31.6	1,125,988	5.7	25,867,053	8.0
50 to 99 acres	33,948	70.0	2,376,444	11.9	42,349,071	13.1
100 to 174 acres	32,466	126.4	4,102,998	20.6	65,986,691	20.4
175 to 259 acres	15,348	209.4	3,213,708	16.2	49,649,212	15.3

500 to 999 acres	4,100	638.1	2,616,261	13.1	36,282,926	11.2
1,000 acres and over	1,100	1,760.7	1,936,750	9.7	26,196,662	7.8

[1] Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$1,195	$423	$69	$250	$438	22.7
Under 3 acres	196	270	15	46	108	20.6
3 to 9 acres	182	169	15	57	108	25.5
10 to 19 acres	244	176	21	73	151	29.3
20 to 49 acres	404	190	27	105	228	31.4
50 to 99 acres	744	289	44	170	349	27.9
100 to 174 acres	1,242	454	70	266	510	25.1
175 to 259 acres	2,031	694	103	407	726	22.4
260 to 499 acres	3,242	1,035	140	627	1,010	20.0
500 to 999 acres	5,896	1,626	206	1,121	1,428	16.1
1,000 acres and over	16,363	3,337	388	2,818	2,900	12.7

The group of farms containing from 260 to 499 acres each comprises a larger total acreage than any other group, but the group containing 100 to 174 acres each represents the greatest value in farm property.

Except for farms of less than 3 acres, the average values increase with the size of the farms. For the group of farms of less than 3 acres each the average values are relatively high, as this group includes many of the florists' establishments of the state and also a large number of city dairies. The incomes from these industries depend less upon the acreage of land used than upon the amount of capital invested and the amounts expended for labor and fertilizers.

The average gross income per acre for the various groups classified by area are as follows: Farms under 3 acres, $60.41; 3 to 9 acres, $18.41; 10 to 19 acres, $11.24; 20 to 49 acres, $7.22; 50 to 99 acres, $4.98; 100 to 174 acres, $4.04; 175 to 259 acres, $3.47; 260 to 499 acres, $2.97; 500 to 999 acres, $2.24; and 1,000 acres and over, $1.65. It will be noted that the average gross income per acre decreases as the farms increase in size.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading features of the statistics relating to farms classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop, and constitutes at least 40 per cent of the total value of products not fed to live stock, the farm is classified as a "hay and grain" farm; if vegetables are the leading crop, constituting 40 per cent of the value of such products, it is a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive 40 per cent of their income from any one class of products. Farms with no income in 1899 are classified according to the agricultural operations upon other farms in the same locality.

TABLE 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	167,886	118.6	19,907,883	100.0	$323,515,977	100.0
Hay and grain	37,469	134.6	5,043,288	25.3	96,905,538	30.0
Vegetables	9,047	66.1	597,728	3.0	19,300,556	6.0
Fruits	1,851	110.2	203,941	1.0	4,769,134	1.5
Live stock	41,156	134.0	5,513,798	27.7	106,510,584	32.9
Dairy produce	1,624	135.2	219,531	1.1	8,618,313	2.7
Tobacco	19,466	128.8	2,506,848	12.6	21,481,571	6.6
Cotton	916	97.4	89,197	0.5	734,345	0.2
Sugar	6	32.5	195	(1)	2,666	(1)
Flowers and plants	56	7.3	409	(1)	427,913	0.1
Nursery products	45	114.2	5,138	(1)	448,320	0.1

[1] Less than one-tenth of 1 per cent.

TABLE 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900. Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	Per cent of gross income on total investment in farm property.
The State	$1,195	$423	$59	$250	$438	22.7
Hay and grain	1,686	547	76	277	470	18.2
Vegetables	1,413	483	68	169	715	33.5
Fruits	1,693	587	68	229	665	25.8
Live stock	1,607	506	69	406	455	17.6
Dairy produce	3,388	1,168	144	607	996	18.8
Tobacco	620	288	45	151	476	43.2
Cotton	448	190	35	129	323	40.3
Sugar	182	80	16	166	96	21.8
Flowers and plants	2,652	4,578	373	38	3,517	46.0
Nursery products	7,529	2,004	211	219	4,180	42.0
Miscellaneous	657	287	41	158	319	27.9

For the several classes of farms the average values per acre of products not fed to live stock are as follows: For farms deriving their principal income from flowers and plants, $481.64; nursery products, $36.61; vegetables, $10.82; dairy produce, $7.37; fruits, $6.03; tobacco, $3.70; hay and grain, $3.49; live stock, $3.39; cotton, $3.32; miscellaneous, $3.14; and sugar, $2.97. The wide variations shown in the averages and percentages of gross income are due largely to the fact that in computing gross income no deduction is made for expenditures. For florists' establishments, nurseries, and market gardens, the average expenditures for such items as labor and fertilizers represent a far larger percentage of the gross income than in the case of "hay and grain," "live stock," or "miscellaneous" farms. Were it possible to present the average net incomes, the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by the reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS. Average.	Total.	Per cent.	VALUE OF FARM PROPERTY. Total.	Per cent.
The State	167,886	118.6	19,907,883	100.0	$323,515,977	100.0
$0	680	63.9	43,428	0.2	641,040	0.2
$1 to $49	9,631	28.8	277,374	1.4	3,240,650	1.0
$50 to $99	18,552	35.6	660,785	3.3	7,717,410	2.4

$2,500 and over	2,247	678.1	1,523,780	7.7	43,253,100	13.4

TABLE 13.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900. Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	Per cent of gross income on total investment in farm property.
The State	$1,195	$423	$59	$250	$438	22.7
$0	650	162	14	117	....	....
$1 to $49	199	93	9	35	29	8.8
$50 to $99	232	110	13	61	72	17.4
$100 to $249	422	181	23	116	166	22.3
$250 to $499	848	337	47	180	355	25.1
$500 to $999	1,800	660	97	386	688	23.4
$1,000 to $2,499	4,334	1,436	204	859	1,456	21.3
$2,500 and over	13,372	3,201	460	2,216	4,539	23.6

The absence of income in the first group is due in part to the fact that the enumerators could not always secure complete reports for farms where changes in ownership or tenancy had occurred shortly prior to the date of enumeration. The persons in charge of such farms on June 1, 1900, could not always give definite information concerning the products of the preceding year. The same statement is true, also, of some of the farms with reported incomes of less than $100. To this extent the reports fall short of giving a complete statement of farm income in 1899. Other farms with small reported incomes are doubtless summer resorts or the country residences of city merchants and professional men who derive their principal incomes from other than agricultural pursuits.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the census of 1900. The age grouping for neat cattle was determined in accordance with their present and prospective relations to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits a very close comparison with previous census reports.

The value of all live stock on farms, June 1, 1900, was $42,026,737. Of this amount, 36.5 per cent represents the value of horses; 24.2 per cent, that of neat cattle other than dairy cows; 15.8 per cent, that of dairy cows; 7.0 per cent, that of mules; 6.1 per cent, that of swine; 5.0 per cent, that of sheep; 4.5 per cent, that of poultry; and 0.9 per cent, that of all other live stock.

No reports were secured of the value of live stock not on farms, but it is probable that such animals have higher average values than those on farms. Allowing the same averages, the value of domestic animals not on farms would be $2,486,687, and the value of all live stock in the state, exclusive of poultry and bees not on farms, was approximately $44,513,424.

Table 14.—DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age in years.	ON FARMS.			NOT ON FARMS.
		Number.	Value.	Average value.	Number.
Calves	Under 1	162,053	$1,273,728	$7.86	4,556
Steers	1 and under 2.	91,579	1,541,054	16.83	810
Steers	2 and under 3.	87,026	2,349,944	27.00	448
Steers	3 and over	79,203	2,899,662	36.61	895
Bulls	1 and over	11,088	294,980	26.60	117
Heifers	1 and under 2.	71,952	1,029,057	14.30	956
Cows kept for milk	2 and over	281,876	6,641,677	23.56	20,029
Cows and heifers not kept for milk.	2 and over	40,735	808,745	19.85	580

Turkeys		207,675			
Geese		125,495			
Ducks		117,989			
Bees (swarms of)		139,064	308,417	2.22	
Value of all live stock.			42,026,737		

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.
[2] Including Guinea fowls.

CHANGES IN LIVE STOCK ON FARMS.

The following table shows the changes since 1850 in the numbers of the most important domestic animals.

Table 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS: 1850 TO 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	281,876	543,636	298,522	47,886	392,125	946,443
1890	273,634	473,700	242,512	37,533	495,313	796,691
1880	243,061	443,123	218,838	33,598	497,289	956,451
1870	188,471	323,272	152,899	26,903	370,145	674,670
1860[2]	330,713	713,754	287,579	41,015	1,043,269	1,599,919
1850[2]	317,619	758,650	272,403	21,483	1,310,004	1,829,843

[1] Lambs not included.
[2] Including the territory now embraced in West Virginia.

Continuous gains are shown for horses and mules since 1870, but not until 1900 did they regain the numbers reported prior to the Civil War. Changes in the character of agricultural industries of the state since the war have caused less attention to be given the production of meat and wool, so that all neat cattle, sheep, and swine are reported in smaller numbers than in 1850. The numbers of dairy cows and other neat cattle have increased regularly but moderately since 1870. The number of sheep has decreased steadily since 1880, with a decline of 20.8 per cent in the last decade. Swine have fluctuated in number from decade to decade, the ten years succeeding 1890 showing an increase of 18.8 per cent. Other classes show increases in numbers for the last decade as follows: Dairy cows, 3.0 per cent; other neat cattle, 14.8 per cent; horses, 23.1 per cent; mules and asses, 27.6 per cent.

In 1900, the enumerators were instructed to report no fowls under three months old, a limitation not made in previous enumerations. This probably accounts, in part, for the following apparent decreases in the numbers of all classes of domestic fowls in the last decade: Ducks, 60.6 per cent; turkeys, 56.5 per cent; geese, 41.9 per cent; chickens, 30.2 per cent.

ANIMAL PRODUCTS.

Table 16 is a summarized statement of animal products for 1899.

Table 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS, IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	2,020,735	$409,602
Mohair and goat hair	Pounds	343	113
Milk	Gallons	[1] 105,068,428	[2] 6,999,994
Butter	Pounds	19,905,830	
Cheese	Pounds	31,697	
Eggs	Dozens	25,550,460	2,836,899
Poultry			3,744,654
Honey	Pounds	1,708,320	195,886
Wax	Pounds	60,110	
Animals sold			7,800,124
Animals slaughtered			5,859,531
Total			27,846,803

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of all milk sold or consumed and of butter and cheese made.

The value of the animal products of 1899 was $27,846,803. Of this amount, 49.1 per cent represents the value of animals sold and animals slaughtered; 25.1 per cent, that of dairy produce; 23.6 per cent, that of poultry products; 1.5 per cent, that of wool, mohair, and goat hair; and 0.7 per cent, that of honey and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

The value of animals sold and animals slaughtered on farms was $13,659,655, or 15.8 per cent of all farm products, and 18.6 per cent of the gross income. Of the farmers in the state reporting live stock, 138,538, or 88.5 per cent, report animals slaughtered, the average value per farm being $42.30. Sales were reported by 70,706 farmers, or 42.1 per cent of all in the state, the average receipts per farm being $110.32. In obtaining these reports the enumerators were instructed to secure from each farm operator a statement of the amount received from the sale of live animals in 1899, less the amount expended for animals purchased during the same year.

DAIRY PRODUCE.

In 1899, 126,784 farmers, or 75.5 per cent of all in the state, reported dairy products. Of the $6,999,994 given in Table 16 as the value of dairy products, $5,151,473, or 73.6 per cent, represents the value of dairy products consumed on farms, and $1,848,521, or 26.4 per cent, the amounts received from sales of such products. Of the latter amount, $944,496 was received from the sale of 6,889,183 gallons of milk, $869,314, from 5,238,202 pounds of butter; $32,323, from 59,838 gallons of cream; and $2,388, from 24,310 pounds of cheese.

The production of milk in 1899 was 26,924,969 gallons greater than in 1889, a gain of 34.5 per cent. The amount of butter made on farms increased 10.9 per cent, and that of cheese made on farms decreased 71.0 per cent in the same time.

POULTRY AND EGGS.

The value of poultry products in 1889 was $6,581,553, of which 56.9 per cent represents the value of poultry raised, and 43.1 per cent that of eggs produced. The number of eggs produced was 11,992,889 dozens greater in 1899 than in 1889, a gain of 88.5 per cent. Rockingham and Shenandoah counties were first in the production of eggs, each reporting more than a million dozens.

WOOL.

In 1899 more wool was reported than by any census since 1860. The gain since 1889 was 39.4 per cent. This increase is, however, more apparent than real, owing to the fact that the fleeces of 139,572 sheep were omitted from the table in 1890, but included in a general estimate of wool shorn after the census enumeration.

HONEY AND WAX.

The production of honey in 1899 was 11.6 per cent, and that of wax 36.3 per cent greater than in 1889. Pittsylvania, Bedford, and Franklin counties were first in apiarian products.

HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses and dairy cows, the total number of these animals for each group, and the average number per farm. In computing the averages presented, only those farms which report the kind of stock under consideration are included.

TABLE 17.—HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.			DAIRY COWS.		
	Farms reporting.	Number.	Average per farm.	Farms reporting.	Number.	Average per farm.
Total	123,347	298,522	2.4	126,792	281,876	2.2

175 to 259 acres	13,783	44,710	3.2	14,049	42,349	3.0
260 acres and over	16,373	76,987	4.7	16,391	68,796	4.2
Hay and grain	26,615	78,566	3.0	26,803	68,748	2.6
Vegetable	6,884	13,953	2.0	4,815	8,175	1.7
Fruit	1,305	3,276	2.5	1,277	2,558	2.0
Live stock	33,189	94,006	2.8	36,548	97,348	2.7
Dairy	1,400	6,935	5.0	1,624	15,093	9.3
Tobacco	14,161	27,638	2.0	13,300	18,322	1.4
Cotton	578	869	1.5	559	772	1.4
Miscellaneous[2]	39,215	73,279	1.9	41,866	70,860	1.7

[1] Including "part owners" and "owners and tenants."
[2] Including sugar farms, florists' establishments, and nurseries.

CROPS.

The following table gives the statistics of the principal crops grown in 1899:

TABLE 18.—ACREAGES, QUANTITIES, AND VALUES OF THE PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantity.	Value.
Corn	1,910,085	Bushels	36,748,410	$16,233,756
Wheat	927,266	Bushels	8,907,510	6,161,000
Oats	275,394	Bushels	3,269,430	1,103,616
Barley	2,768	Bushels	53,346	25,007
Rye	31,534	Bushels	246,834	124,1[illegible]5
Buckwheat	19,251	Bushels	244,321	111,731
Broom corn	1,762	Pounds	663,390	34,558
Rice	25	Pounds	4,374	94
Kafir corn	9	Bushels	170	80
Flaxseed	10	Bushels	50	52
Clover seed		Bushels	4,144	19,503
Grass seed		Bushels	20,960	21,097
Hay and forage	612,962	Tons	943,079	7,670,082
Cottonseed		Tons	[1]3,390	34,948
Cotton	25,724	Bales	10,789	346,600
Tobacco	184,334	Pounds	122,884,900	7,210,195
Hops	(2)	Pounds	165	17
Peanuts	116,914	Bushels	3,713,347	2,261,148
Dry beans	6,411	Bushels	56,189	66,066
Dry pease	22,206	Bushels	219,142	218,477
Potatoes	51,021	Bushels	4,409,672	2,494,627
Sweet potatoes	40,681	Bushels	4,470,602	1,720,188
Onions	1,717	Bushels	205,869	143,299
Miscellaneous vegetables	97,285			4,725,160
Maple sugar		Pounds	19,310	1,816
Maple sirup		Gallons	1,677	1,534
Sorghum cane	8,039	Tons	[3]2,320	6,012
Sorghum sirup		Gallons	555,321	190,903
Small fruits	8,796			765,097
Grapes	[4]1,663	Centals	36,089	[5]87,737
Orchard fruits	[4]206,362			[6]2,662,483
Tropical fruits				158
Nuts				5,109
Forest products				3,797,116
Flowers and plants	143			238,712
Seeds	22			3,384
Nursery products	1,200			214,988
Miscellaneous				1,197
Total	4,553,584			58,701,742

[1] Exclusive of 1,779 tons, valued at $18,344, sold in seed cotton and included with the cotton.
[2] Less than 1 acre.
[3] Sold as cane.
[4] Estimated from number of vines or trees.
[5] Including value of raisins, wine, etc.
[6] Including value of cider, vinegar, etc.

Of the total value of crops, cereals contributed 40.5 per cent; hay and forage, 13.1 per cent; tobacco, 12.3 per cent; miscellaneous vegetables, 8.0 per cent; forest products, 6.5 per cent; orchard fruits, 4.5 per cent; potatoes, 4.2 per cent; peanuts, 3.9 per cent; sweet potatoes, 2.9 per cent; small fruits, 1.3 per cent; and all other products, 2.8 per cent.

The average values per acre of the various crops are as follows: Flowers and plants, $1,669; nursery products, $179; small fruits, $87; potatoes, $49; sweet potatoes, $42; tobacco, $39; sorghum cane and sorghum sirup, $24; broom corn, $20; peanuts, $19; cotton and cottonseed, $15; orchard fruits, $13; hay and forage, $13; dry beans, $10; dry pease, $10; and cereals, $8.

The crops yielding the highest average returns per acre were grown upon very highly improved land. Their production required a relatively great amount of labor and large expenditures for fertilizers.

CEREALS.

The following table is an exhibit of the changes in cereal production since 1849.

TABLE 19.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899.

PART 1.—ACREAGE.

YEAR.[1]	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	2,768	19,251	1,910,085	275,394	31,534	927,266
1889	2,051	5,170	1,600,690	495,508	52,063	737,510
1879	859	16,463	1,768,127	563,443	48,746	901,177

PART 2.—BUSHELS PRODUCED.

YEAR.[1]	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	53,340	244,321	36,748,410	3,269,430	246,834	8,907,510
1889	40,982	41,199	27,172,493	5,695,100	397,394	7,904,092
1879	14,223	136,004	29,119,761	5,333,181	324,431	7,826,174
1869	7,259	45,075	17,649,304	6,857,555	582,264	7,398,787
1859[2]	68,846	478,090	38,319,999	10,186,720	944,330	13,130,977
1849[2]	25,437	214,898	35,254,319	10,179,144	458,930	11,212,616

[1] No statistics of acreage were secured prior to 1879.
[2] Including the territory now embraced in West Virginia.

Of the total land surface of the state, 12.3 per cent was devoted to cereals in 1899. The total area in cereals was 2,892,992 acres in 1889, and 3,166,298 acres in 1899, an increase of 9.4 per cent. During the last ten years the area in corn has increased 19.3 per cent; wheat, 25.7 per cent; buckwheat, 272.4 per cent; and barley, 35.0 per cent; while that in oats decreased 44.4 per cent, and that in rye, 39.4 per cent.

In 1899, 60.3 per cent of the total acreage in cereals was devoted to corn; 29.3 per cent, to wheat; 8.7 per cent, to oats; 1.0 per cent, to rye; and 0.7 per cent, to buckwheat, barley, rice, and Kafir corn. Corn is the most important, being reported by 156,703 farmers, or 93.3 per cent of the total number in the state. Pittsylvania, Fauquier, Loudoun, Halifax, Caroline, and Accomac counties, in the eastern part, report nearly one-seventh of the total acreage in corn. Augusta and Rockingham, in the north, contain more than one-eighth of the wheat acreage and three-fifths of the barley acreage, while the southern counties of Bedford, Franklin, Halifax, and Pittsylvania report one-fifth of the acreage devoted to oats. Frederick and Carroll counties lead in the production of rye, and Carroll, Floyd, Grayson, and Smith counties, in the production of buckwheat.

HAY AND FORAGE.

In 1900, 115,910 farmers, or 69.0 per cent of the total number, reported hay and forage crops, from which, exclusive of cornstalks and corn strippings, they obtained an average yield of 1.0 tons per acre. The total area in hay and forage in 1899 was 612,962 acres, or 1.3 per cent greater than ten years before.

In 1899 the acreages and yields of the various kinds of hay and forage were as follows: Wild, salt, and prairie grasses, 2,696 acres and 2,922 tons; millet and Hungarian grasses, 13,315 acres and 15,294 tons; alfalfa or lucern, 349 acres and 521 tons; clover, 104,124 acres and 105,640 tons; other tame and cultivated grasses, 442,070 acres and 437,436 tons; grains cut green for hay, 40,531 acres and 44,329 tons; crops grown for forage, 9,877 acres and 21,837 tons; and cornstalks and corn strippings, 623,174 acres and 315,100 tons.

In Table 18 the production of cornstalks and corn strippings is included under "hay and forage," but the acreage is included under "corn," as the forage secured was an incidental product of the corn crop.

TOBACCO.

According to the census of 1850, 56,803,227 pounds of tobacco were produced in Virginia in 1849. In all subsequent decades the crop has undergone great fluctuations. The census of 1860 showed a gain over that of 1850 of 67,165,085 pounds, or 118.2 per cent, but the next census showed a decline of 86,881,948 pounds, or 70.1 per cent. Between 1870 and 1880 there was a gain of 42,902,504 pounds, or 115.7 per cent, while the decade between 1880 and 1890 was marked by another decline, the loss being 31,466,213 pounds, or 39.3 per cent.

The present census shows that in 1899 tobacco was grown in Virginia by 44,872 farmers, who obtained from 184,334 acres a yield of 122,884,900 pounds. This was a gain of 73,755 acres, or 66.7 per cent, over the crop area of 1889, and an increase in production of 74,362,245 pounds, or 153.3 per cent, in the last ten years. The total value of the crop was $7,210,195, an average of $160.68 for each farm reporting. The average yield per acre in 1899 was 667 pounds, against 439 pounds in 1889, and 568 pounds in 1879. The average area for each farm on which tobacco was grown was 4.1 acres.

The tobacco crop of 1899 was distributed over 88 counties of the state, the leading county being Pittsylvania, with an area of 29,806 acres. The next in rank was Halifax, and the third Mecklenburg. These three counties together contributed 34.7 per cent of the total acreage and 30.5 per cent of the total production. The counties next in order were Bedford, Charlotte, Campbell, Henry, Amherst, Warren, Prince Edward, Lunenburg, Franklin, and Appomattox. These 13 counties together furnished 72.4 per cent of the acreage and 70.3 per cent of the entire production of the state.

COTTON.

The following table is a statement of the changes in cotton production since 1859.

Table 20.—ACREAGE AND PRODUCTION OF COTTON: 1859 TO 1899.

YEAR.[1]	ACREAGE.		PRODUCTION.		
	Total.	Per cent of increase.	Commercial bales.	Pounds.	Per cent of increase.
1899	25,724	[1]34.4	10,789	5,166,630	101.5
1889	39,213	[1]12.9	5,375	2,563,875	[2]71.1
1879	45,040		19,595	8,876,535	11,076.4
1869[3]				79,422	[2]98.6
1859[3]				5,663,515	

[1] No statistics of acreage were secured prior to 1880.
[2] Decrease.
[3] Including the territory now embraced in West Virginia.

In 1879, Virginia produced the largest crop of cotton reported for that state by any census. The decrease shown for 1869 was the direct result of the effects of the Civil War. The decade ending in 1889 witnessed another decrease in the production of cotton amounting to 71.1 per cent.

In 1899, 4,761 farmers devoted an area of 25,724 acres, or 0.3 per cent of the total improved farm land of the state to cotton, an average of 5.4 acres per farm. From this land was produced 5,166,630 pounds of cotton, an average of 201 pounds per acre. The total value of this crop, including the value of the cotton seed, was $381,548, an average of $80.14 per farm and $14.83 per acre. This value constituted 0.5 per cent of the gross farm income.

Of the 118 counties in the state, only 24 report cotton. Those devoting the greatest area to this crop were Brunswick, Greenesville, Southampton, Mecklenburg, and Sussex, ranking in the order named and reporting 91.1 per cent of the total acreage. They are located in the south central and southeastern parts of the state.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 are shown in the following table:

Table 21.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900	1890	1899	1889
Apples	8,190,025	4,253,364	9,835,982	8,391,425
Apricots	2,950	1,793	678	1,024
Cherries	269,690	132,631	188,693	100,217
Peaches	1,939,113	1,218,219	357,339	1,052,000
Pears	291,288	122,917	88,400	51,553
Plums and prunes	118,193	16,022	21,167	2,886

The total number of fruit trees in 1890 was 5,744,946, while in 1900 there were 10,828,777, showing an increase of 5,083,831, or 88.5 per cent. The rates of increase for the several varieties are as follows: Plums and prunes, more than sixfold; pears, 136.9 per cent; cherries, 103.3 per cent; apples, 92.6 per cent; apricots, 64.5 per cent; and peaches, 59.2 per cent.

Of the total number of trees reported in 1900, 75.6 per cent were apple trees; 17.9 per cent, peach trees; 2.7 per cent, pear trees; 2.5 per cent, cherry trees; and 1.3 per cent, apricot, plum and prune, and unclassified trees, the last class, which is not included in the table, numbering 17,518 trees, and yielding 5,142 bushels of fruit.

The value of orchard products, given in Table 18, includes the value of 43,995 barrels of cider, 16,414 barrels of vinegar, and 2,302,480 pounds of dried and evaporated fruits.

SMALL FRUITS.

The total area used in the cultivation of small fruits in 1899 by the 11,147 farmers reporting them was 8,796 acres, an average of 0.8 acres per farm. Of the total, 7,821 acres, or 88.9 per cent, were devoted to strawberries, which yielded 12,270,300 quarts. Of this fruit, 72.4 per cent of the acreage and 73.1 per cent of the yield were reported by Norfolk, Princess Anne, and Accomac, three extreme eastern counties bordering on Chesapeake Bay. The acreages and productions of the other berries were as follows: Blackberries and dewberries, 444 acres and 532,830 quarts; raspberries and Logan berries, 365 acres and 424,110 quarts; gooseberries, 66 acres and 75,140 quarts; currants, 39 acres and 42,060 quarts; and other small fruits, 61 acres and 79,480 quarts.

VEGETABLES.

The total value of vegetables grown in 1899, including potatoes, sweet potatoes, and onions, was $9,083,274, of which 27.5 per cent represents the value of potatoes; 18.9 per cent, that of sweet potatoes; 1.6 per cent, that of onions, and 52.0 per cent, that of miscellaneous vegetables.

Potatoes were grown in 1899 by 83,780 farmers, or 49.9 per cent of the total number in the state. The area devoted to this crop in 1889 was 36,412 acres, and that in 1899, 51,021 acres, a gain of 40.1 per cent.

In the growing of miscellaneous vegetables, 97,285 acres were used. Of this area, the products of 55,561 acres were not reported in detail. Of the remaining 41,724 acres, 10,105 acres were devoted to cabbages; 9,815 acres, to tomatoes; 9,297 acres, to watermelons; 3,028 acres, to muskmelons; 2,015 acres, to sweet corn; 1,861 acres, to spinach; 1,603 acres, to cucumbers; 1,222 acres, to beans; 1,131 acres, to pease; and 1,647 acres, to other vegetables.

PEANUTS.

Peanuts were grown in 1899 by 11,572 farmers, or 6.9 per cent of the total number in the state. The area devoted to their cultivation was 116,914 acres, and the product secured therefrom 3,713,347 bushels. Increases of 98.3 per cent in acreage and 216.9 per cent in production are shown for the last decade. The average yield per acre was 19.9 bushels in 1889 and 31.8 in 1899.

The leading counties are Southampton, Nansemond, Isle of Wight, Sussex, and Prince George, ranking in the order named, and reporting, in the aggregate, 76.3 per cent of the total acreage.

SORGHUM CANE.

The present census shows that in 1899 sorghum cane was grown by 19,304 farmers on 8,039 acres, an average of 0.4 acres for each farm reporting. From this area they sold 2,320 tons of cane for $6,012, and from the remaining product manufactured 555,321 gallons of sirup, valued at $190,903. This was a decrease in acreage from that of 1889 of 16.1 per cent. The total value of sorghum-cane products of 1899 was $196,915, an average of $10.20 for each farm reporting, and of $24.50 per acre.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 143 acres, and the value of the products sold therefrom was $238,712. These flowers and plants were grown by 134 farmers and florists, of whom 56 made commercial floriculture their principal business. These 56 proprietors had invested in land, buildings, implements, and live stock $427,913, of which $256,375 represents the value of buildings. Their sales of flowers and plants amounted to $191,845, and they obtained other products valued at $5,145. They expended for labor $44,350, and for fertilizers $4,295. The average annual income for each farm reporting, including products fed to live stock, was $3,521.

In addition to the 56 principal florists' establishments, 3,028 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 2,887,643 square feet, making, with the 596,617 square feet belonging to the florists' establishments, a total of 3,484,260 square feet of land under glass.

NURSERIES.

The total value of the nursery products sold in 1899 was $214,988, reported by the operators of 89 farms. Of this number 45 derived their principal income from the nursery business. They had 5,138 acres of land, valued at $338,790; buildings worth $90,175; implements and machinery worth $9,480; and live stock worth $9,875. The value of their products in 1899, exclusive of products fed to live stock, was $188,116, of which $178,016 represents the value of nursery products and $10,100 that of other products. The expenditure for labor was $41,155, and for fertilizers, $4,609. The average income for each farm reporting, including the value of products fed to live stock, was $4,281.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $7,790,720, an average of $46 per farm. The average expenditure was $915 for nurseries, $792 for florists' establishments, $134 for dairy farms, $112 for vegetable farms, $78 for fruit farms, $53 for hay and grain farms, $44 for live-stock farms, and $43 for tobacco farms. "Managers" expended on an average $275; "owners," $48; "cash tenants," $43; and "share tenants," $29. White farmers expended $60 per farm and colored farmers, $10.

Fertilizers purchased in 1899 cost $3,681,790, an average of $22 per farm and an increase since 1890 of 58.7 per cent. The average expenditure was $102 for nurseries, $90 for vegetable farms, $77 for florists' establishments, $34 for tobacco farms, $31 for dairy farms, $30 for fruit farms, $21 for hay and grain farms, and $14 for live-stock farms.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 224. WASHINGTON, D. C. July 3, 1902.

AGRICULTURE.

MISSOURI.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

Sir: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the state of Missouri, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land, under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It also includes the house in which the farmer resides and all other buildings used by him in connection with his farming operations.

The farms of Missouri, June 1, 1900, numbered 284,886 and were valued at \$843,979,213, of which amount \$148,508,490, or 17.6 per cent, represents the value of buildings, and \$695,470,723, or 82.4 per cent, the value of the land and improvements other than buildings. On the same date the value of farm implements and machinery was \$28,602,680, and of live stock, \$160,540,004. These values added to that of farms give \$1,033,121,897, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was \$219,296,970, of which amount \$97,841,944, or 44.6 per cent, represents the value of animal products, and \$121,455,026, or 55.4 per cent, the value of crops including forest products cut or produced on farms. The total value of farm products for 1899 exceeds that for 1889 by \$109,545,946, an increase of 99.8 per cent, but a part of this gain is doubtless due to a more detailed enumeration in 1900 than in 1890.

The "gross farm income" is obtained by deducting from the total value of farm products the value of the products fed to live stock on the farms of the producers. In 1899 the reported value of products fed was \$57,952,360, leaving \$161,344,610 as the gross farm income. The ratio which this latter amount bears to the "total value of farm property" is referred to as the "percentage of gross income upon investment." For Missouri, in 1899, it was 15.6 per cent.

As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

The statistics presented in this bulletin will be treated in greater detail in the report on agriculture in the United States. The present publication is designed to present a summarized advance statement for Missouri.

Very respectfully,

L. G. Powers.
Chief Statistician for Agriculture.

AGRICULTURE IN MISSOURI.

GENERAL STATISTICS.

Missouri has a total land area of 68,735 square miles, or 43,990,400 acres, of which 33,997,873 acres, or 77.3 per cent, are included in farms.

The surface of Missouri is divided into two unequal portions by the Missouri River, which takes a zigzag course from west to east across the state. That part lying south of the river includes about two-thirds the area of the state and is of a varied nature. Its eastern portion is low and swampy and subject to frequent overflows by the Mississippi River and its tributaries. Above the swamps are limestone bluffs which extend westward, but are less precipitous as they approach the Osage River. In the south and west are the Ozark Mountains, rendering this region broken and hilly, the isolated peaks varying in height from 500 to 1,000 feet, and inclosing many fertile valleys. The northern part of the state is generally rolling prairie.

The immediate valley of the Missouri has a rich alluvial soil of great fertility, while other portions have soils, which are very productive, practically without fertilization.

NUMBER AND SIZE OF FARMS.

The following table gives, by decades, since 1850, the number of farms, the total and average acreage, and the per cent of farm land improved:

Table 1.—FARMS AND FARM ACREAGE: 1850 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	284,886	33,997,873	22,900,043	11,097,830	119.3	67.4
1890	238,043	30,780,290	19,792,313	10,987,977	129.3	64.3
1880	215,575	27,879,276	16,745,031	11,134,245	129.3	60.1
1870	148,328	21,707,220	9,130,615	12,576,605	146.3	42.1
1860	92,792	19,984,810	6,246,871	13,737,939	215.4	31.3
1850	54,458	9,732,670	2,938,425	6,794,245	178.7	30.2

The number of farms reported, June 1, 1900, was more than five times as great as that reported in 1850, and 19.7 per cent greater than in 1890. The total acreage of farm land, also, has rapidly increased, the gain for the last decade being 10.5 per cent. Since 1860 the number of farms has gained faster than the total acreage, involving a decrease in the average size of farms and indicating a progressive division of farm holdings. A steady increase is shown in the acreage and per cent of improved land.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1850.

Table 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND OF FARM PRODUCTS: 1850 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$1,033,121,897	$843,979,213	$28,602,680	$160,540,004	$219,296,970
1890	786,390,253	625,858,361	21,830,719	138,701,173	109,751,024
1880	489,521,663	375,633,307	18,103,074	95,785,282	95,912,660
1870[2]	492,789,746	392,908,047	15,596,426	84,285,273	[3]103,035,759
1860	293,037,307	230,632,126	8,711,508	53,693,673	....
1850	87,094,648	63,225,543	3,981,525	19,887,580	....

[1] For year preceding that designated.
[2] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other years they must be diminished one-fifth.
[3] Includes betterments and additions to live stock.

Since 1850 the total value of farm property has increased $946,027,249, and in the last decade $246,731,644, or 31.4 per cent. For the same decade the gain in the value of land, improvements, and buildings was $218,120,852, or 34.9 per cent; in that of implements and machinery, $6,771,961, or 31.0 per cent; and in that of live stock, $21,838,831, or 15.7 per cent. The value of the farm products of 1899 was nearly twice that of 1889. A portion of this increase, and of that shown for implements and machinery, is doubtless the result of a more detailed enumeration in 1900 than in previous census years.

COUNTY STATISTICS.

Table 3 gives an exhibit of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH GROSS INCOME (PRODUCTS OF 1899 NOT FED TO LIVE STOCK), AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Gross income (products of 1899 not fed to live stock).	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.
The State	284,886	275,634	33,997,873	22,900,043	$695,470,723	$148,508,490	$28,602,680	$160,540,004	$161,344,610	$9,803,610	$370,630

All counties report increases in the number of farms in the last decade. Only five counties, Dunklin, Iron, Lincoln, Madison, and Washington, report decreases in farm area. It is probable that the decrease in improved acreage reported by a few counties is due to the use of a more strict definition of the term "improved" by the Twelfth than by any preceding census. The smallest farms are in the cotton counties, and in those where there are numerous vegetable farms and florists' establishments, and the largest, where cereals and live-stock raising are the chief agricultural pursuits. The average size of farms for the state is 119.3 acres, and varies from 14.0 acres in St. Louis city to 169.0 acres in Ste. Genevieve county.

Except Cole and Dallas counties, all report an increased total value of farms in the last ten years. The average value of farms for the state is $2,963. Most counties show increases in the value of implements and machinery, the average per farm being $100. The value of live stock increased in nearly all counties, only eight reporting a smaller value in 1900 than in 1890.

FARM TENURE.

Table 4 gives a comparative exhibit of farm tenure for 1880, 1890, and 1900. The farms operated by tenants are divided into groups designated as farms operated by "cash tenants," who pay a cash rental or a stated amount of labor or farm produce, and farms operated by "share tenants," who pay as rental a share of the products.

In Table 5 the tenure of farms for 1900 is given by race of farmer. "Farms operated by owners" are subdivided into four groups designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it, and the other or others owning no part, but receiving for supervision or labor a share of the products; (4) farms operated by individuals who receive for their supervision and other services a fixed salary from the owners.

TABLE 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 TO 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.
1900	284,886	197,989	31,230	55,667	69.5	11.0	19.5
1890	238,043	174,285	23,525	40,233	73.2	9.9	16.9
1880	215,575	156,703	19,843	39,029	72.7	9.2	18.1

[1] Including "part owners," "owners and tenants," and "managers."

TABLE 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

PART 1.—NUMBER OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State.	284,886	159,223	31,747	5,188	1,831	31,230	55,667
White	279,933	157,322	31,040	5,136	1,794	30,399	54,242
Colored[1]	4,953	1,901	707	52	37	831	1,425

PART 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State.	100 0	55.9	11.2	1.8	0.6	11.0	19.5
White	100.0	56.2	11.1	1.8	0.6	10.9	19.4
Colored[1]	100.0	38.4	14.3	1.0	0.7	16.8	28.8

[1] Comprising 3 Indians and 4,950 negroes.

Between 1890 and 1900 the number of farms operated by owners increased 23,704, or 13.6 per cent; cash tenant farms increased 7,705, or 32.8 per cent; and share tenant farms, 15,434, or 38.4 per cent. In 1890, 63.1 per cent of all tenants were share tenants, and in 1900, 64.1 per cent.

Of the farmers of the state, 98.3 per cent are white and 1.7 per cent, colored. Of the white farmers, 69.1 per cent own all or a part of the farms they operate; 30.9 per cent operate farms owned by others. For colored farmers the corresponding percentages are 53.7 and 46.3.

The number of cash tenants exceeds that of share tenants in a number of counties where the farms are more intensively cultivated and more valuable than elsewhere. They are chiefly situated near the principal cities and are generally north of the Missouri River.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the number conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

TABLE 6.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	284,886	119.3	33,997,873	100.0	$1,033,121,897	100.0
White	279,933	120.5	33,726,480	99.2	1,025,151,594	99.2

[1] Comprising 3 Indians and 4,950 negroes.

TABLE 7.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY RACE OF FARMER AND BY TENURE.

RACE OF FARMER, AND TENURE.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$2,441	$521	$100	$564	$566	15.6
White	2,464	527	101	570	571	15.6
Colored[1]	1,182	174	45	208	282	17.5
Owners	2,417	601	108	619	591	15.8
Part owners	2,916	552	118	702	678	15.8
Owners and tenants	3,254	646	137	791	686	14.2
Managers	8,895	1,460	201	2,057	1,608	12.8
Cash tenants	2,804	426	88	446	562	14.9
Share tenants	1,750	287	69	320	389	16.0

[1] Comprising 3 Indians and 4,950 negroes.

The value of farm property of the colored farmers is $7,970,303, an average value of $1,609 per farm, or about one-half the average value of farms operated by white farmers, $3,662. The higher percentage of gross income for the farms of colored farmers does not indicate superior farm management, but is due to the smaller average area and consequent more intensive cultivation of these farms, and to the smaller value of farms or capital invested. For farms of the same area white farmers obtain slightly larger percentage of gross income, though for every form of farm property their farms show average values.

Farms operated by share tenants have the lowest average area, 90.3 acres, while those operated by managers have the highest, 354.2 acres. As a rule the latter are favorably located, highly improved, and sometimes not primarily cultivated for profit when adjuncts of public institutions or when conducted by wealthy individuals in connection with their summer homes. This should account for the comparatively low percentage of gross income for this group.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	284,886	119.3	33,997,873	100.0	$1,033,121,897	100.0
Under 3 acres	1,469	1.8	2,682	(1)	2,670,825	0.3
3 to 9 acres	6,333	6.3	40,179	0.1	8,092,619	0.8
10 to 19 acres	11,286	13.8	155,332	0.5	13,863,223	1.3
20 to 49 acres	56,931	35.6	2,028,673	6.0	75,355,286	7.3
50 to 99 acres	78,933	74.5	5,885,823	17.3	182,619,027	17.7

175 to 259 acres	29,014	210.2	6,097,961	17.9	183,200,387	17.7
260 to 499 acres	18,117	334.0	6,051,799	17.8	182,400,410	17.7
500 to 999 acres	3,268	639.7	2,090,466	6.1	63,525,369	6.1
1,000 acres and over	594	1,804.0	1,071,561	3.2	24,805,366	2.4

[1] Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$2,441	$521	$100	$564	$566	15.6
Under 3 acres	750	803	54	211	725	39.8
3 to 9 acres	706	413	39	120	233	18.2
10 to 19 acres	770	279	40	139	207	16.9
20 to 49 acres	836	237	60	201	265	20.0
50 to 99 acres	1,526	367	80	341	411	17.8
100 to 174 acres	2,526	567	112	553	596	16.9
175 to 259 acres	4,340	832	161	981	911	14.4
260 to 499 acres	6,952	1,202	214	1,700	1,344	13.3
500 to 999 acres	13,660	1,958	294	3,627	2,470	12.7
1,000 acres and over	29,762	3,409	517	8,072	5,099	12.2

The group of farms containing from 100 to 174 acres each, comprises the largest percentage of the total farm acreage, and also the largest percentage of the total value of farm property. In this group the average values of the various forms of farm property approach nearest to the averages for the state. Except for farms under 3 acres, the average values of the several forms of farm property generally advance with the size of the farm. For farms of less than 3 acres the average value of buildings exceeds that of land and improvements, as this class includes most of the florists' establishments and many city dairies.

The average gross incomes per acre for the various groups are as follows: Farms under 3 acres, $396.76; 3 to 9 acres, $36.73; 10 to 19 acres, $15.04; 20 to 49 acres, $7.43; 50 to 99 acres, $5.51; 100 to 174 acres, $4.45; 179 to 259 acres, $4.34; 260 to 499 acres, $4.02; 500 to 999 acres, $3.86; and 1,000 acres and over, $2.83. The relatively high gross income per acre for farms of less than 3 acres is due to the fact that the incomes of the florists' establishments and city dairies, of which this group is largely composed, do not depend so much upon the acreage of land used as upon the amount of capital invested in buildings, implements, and live stock, and the amounts expended for labor and fertilizers.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

In Tables 10 and 11 farms are classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop and constitutes at least 40 per cent of the total value of the products not fed to live stock, the farm is classified as a "hay and grain" farm. If vegetables are the leading crop, constituting 40 per cent of the value of the products not fed to live stock, the farm is designated as a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive 40.0 per cent of their income from any one class of farm products. Farms reporting no income in 1899 are classified according to the agricultural operations upon other farms in the same locality.

TABLE 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	284,886	119.3	33,997,873	100.0	$1,033,121,897	100.0
Hay and grain	76,733	118.8	9,118,904	26.8	280,269,603	27.1
Vegetables	4,267	36.1	153,868	0.5	16,254,188	1.6
Fruit	2,592	80.9	209,666	0.6	8,421,362	0.8
Live stock	151,451	133.0	20,148,833	59.3	618,720,308	59.9
Dairy produce	6,021	95.9	577,575	1.7	27,660,208	2.7
Tobacco	264	74.6	19,696	0.1	596,140	(1)
Cotton	2,236	50.4	112,676	0.3	2,904,796	0.3
Sugar	118	71.2	8,405	(1)	197,575	(1)
Flowers and plants	183	3.4	618	(1)	1,088,436	0.1
Nursery products	116	83.2	9,650	(1)	872,140	0.1
Miscellaneous	40,905	88.9	3,637,982	10.7	76,137,141	7.4

[1] Less than one-tenth of 1 per cent.

TABLE 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900.					Per cent of gross income on total investment in farm property.
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	
The State	$2,441	$521	$100	$564	$566	15.6
Hay and grain	2,663	469	104	417	563	15.4
Vegetables	3,013	537	91	168	522	13.7
Fruit	2,323	616	88	222	510	15.7
Live stock	2,635	599	110	741	640	15.7
Dairy produce	3,151	680	102	661	644	14.0
Tobacco	1,475	360	63	360	478	21.2
Cotton	833	189	45	232	485	37.3
Sugar	1,115	247	77	235	384	22.9
Flowers and plants	3,053	2,689	160	45	2,285	38.4
Nursery products	5,687	1,441	204	186	3,141	41.8
Miscellaneous	1,238	309	62	252	286	15.4

For the several classes of farms the average value per acre of products not fed to live stock are as follows: For farms deriving their principal income from flowers and plants, $676.74; nursery products, $37.76; vegetables, $14.48; cotton, $9.62; tobacco, $6.40; fruit, $6.30; sugar, $5.39; live stock, $4.81; hay and grain, $4.74; and miscellaneous products, $3.22.

The wide variations shown in the averages and percentages of gross income are largely due to the fact that in computing gross income no deductions are made for expenses involved in operations. For florists' establishments, nurseries, and market gardens, the average expenditure for such items as labor and fertilizers, represents a far greater percentage of gross income than for "hay and grain," "live-stock," or "miscellaneous" farms. If it were possible to present the average net incomes, the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by the reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.

$1,000 to $2,499	32,417	225.1	7,296,719	21.5	288,263,777	27.9
$2,500 and over	5,142	436.7	2,245,285	6.6	104,154,810	10.1

TABLE 13.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900.					Per cent of gross income on total investment in farm property.
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	
The State	$2,441	$521	$100	$564	$566	15.6
$0	1,538	187	33	427	....	....
$1 to $49	558	122	23	104	31	3.8
$50 to $99	573	143	28	119	70	8.2
$100 to $249	854	219	43	210	170	12.8
$250 to $499	1,585	379	79	369	358	14.8
$500 to $999	3,024	662	133	658	688	15.4
$1,000 to $2,499	6,131	1,194	213	1,354	1,417	15.9
$2,500 and over	13,694	2,257	355	3,950	4,338	21.4

The absence of income in the first group is due, in part, to the fact that the enumerators could not always secure complete reports for farms where changes in ownership or tenancy had occurred shortly prior to the date of enumeration. The persons in charge of such farms, on June 1, 1900, could not always give definite information concerning the products of the preceding year. The same statement is true, also, of some of the farms with reported incomes of less than $100. To this extent the reports fall short of giving a complete exhibit of farm income in 1899. Some of the farms with small reported incomes are doubtless the suburban or summer homes of city merchants and professional men who derive their principal income from other than agricultural pursuits.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the Twelfth Census. The age grouping for neat cattle was determined in accordance with their present and prospective relations to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits a very close comparison with previous census reports.

Table 14 presents a summary of live-stock statistics.

TABLE 14.—DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age in years.	ON FARMS.			NOT ON FARMS.
		Number.	Value.	Average value.	Number.
Calves	Under 1	633,317	$6,943,267	$10.96	13,410
Steers	1 and under 2	386,809	8,713,534	22.53	2,320
Steers	2 and under 3	363,775	12,451,823	34.23	3,388
Steers	3 and over	148,965	6,818,862	45.77	10,624
Bulls	1 and over	43,390	1,921,821	44.29	978
Heifers	1 and under 2	312,749	6,040,589	19.31	2,922
Cows kept for milk	2 and over	765,386	23,514,794	30.72	49,192
Cows and heifers not kept for milk.	2 and over	324,198	9,252,117	28.54	1,436
Colts	Under 1	58,177	1,277,129	21.95	1,299
Horses	1 and under 2	63,214	2,070,506	32.75	1,109
Horses	2 and over	845,646	38,747,179	45.82	127,105
Mule colts	Under 1	41,424	1,140,502	27.53	262
Mules	1 and under 2	47,111	1,939,879	41.18	415
Mules	2 and over	194,984	12,401,901	63.60	12,065
Asses and burros	All ages	8,777	1,111,893	126.68	658
Lambs	Under 1	423,510	999,349	2.36	805
Sheep (ewes)	1 and over	587,757	2,060,859	3.51	7,210
Sheep (rams and wethers).	1 and over	75,946	290,638	3.83	692
Swine	All ages	4,524,664	16,533,935	3.65	109,678
Goats	All ages	24,487	64,786	2.65	988
Fowls:[1]					
Chickens[2]		14,903,601	5,720,359		
Turkeys		466,665			
Geese		428,307			
Ducks		278,140			
Bees (swarms of)		205,110	508,217	2.48	
Unclassified			16,065		
Value of all live stock.			160,540,004		

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.
[2] Including Guinea fowls.

The value of all live stock on farms, June 1, 1900, was $160,540,004. Of this amount, 32.5 per cent represents the value of neat cattle other than dairy cows; 26.2 per cent, that of horses; 14.6 per cent, that of dairy cows; 10.3 per cent, that of swine; 9.6 per cent, that of mules; 3.6 per cent, that of poultry; 2.1 per cent, that of sheep; 0.7 per cent, that of asses and burros; and 0.4 per cent, the value of all other live stock.

No reports were received of the value of live stock not on farms, but it is probable that such animals have higher average values than those on farms. Allowing the same averages, however, the value of live stock not on farms was $9,649,952. Exclusive of poultry and bees not on farms, the total value of live stock in the state was $170,189,956.

CHANGES IN LIVE STOCK ON FARMS.

The following table shows the changes since 1850 in the numbers of the most important domestic animals:

TABLE 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS: 1850 TO 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	765,386	2,213,203	967,037	292,296	663,703	4,524,664
1890	851,076	2,118,640	946,401	251,714	950,562	4,987,432
1880	661,405	1,419,527	667,776	192,027	1,411,298	4,553,123
1870	398,515	755,180	493,969	111,502	1,352,001	2,306,430
1860	345,243	823,741	361,874	80,941	937,445	2,354,425
1850	230,169	561,341	225,319	41,667	762,511	1,702,625

[1] Lambs not included.

For the fifty years following 1850 every class of live stock, except sheep, shows a great increase in numbers. Between 1850 and 1880 the number of sheep increased, decade by decade, but since that time each succeeding decade shows a larger decrease.

In 1900 dairy cows, sheep, and swine were reported in smaller numbers than in 1890, and other classes of live stock show but small increases, owing to the excellent market for all classes of live stock just previous to the time of enumeration, and the high prices at that time. (See Table 14.) For the year 1899, 55.2 per cent of the value of all animal products for the state was derived from the sale of live animals, greatly reducing the flocks and herds.

Compared with the census of 1890, that of 1900 shows the following increases: Mules and asses, 16.1 per cent; neat cattle other than dairy cows, 4.5 per cent; horses, 2.2 per cent. Sheep decreased 30.2 per cent; dairy cows, 10.1 per cent; and swine, 9.3 per cent.

In 1900 the enumerators were instructed to report no fowls under 3 months old, which limitation was not made in previous census reports. This probably accounts for the apparent decreases in the numbers of all domestic fowls. Compared with the figures for 1890, the census of 1900 shows decreases in numbers of fowls as follows: Ducks, 55.7 per cent; turkeys, 49.8 per cent; geese, 49.6 per cent; and chickens, 34.6 per cent. The increased production of eggs indicates that there have been increases in the numbers of most kinds of fowls.

ANIMAL PRODUCTS.

Table 16 is a summarized statement of the products of the animal industry in 1899.

TABLE 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS, IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	4,145,137	$822,871
Mohair and goat hair	Pounds	10,203	2,798
Milk	Gallons	[1]258,207,755	[2]15,042,360
Butter	Pounds	45,509,110	
Cheese	Pounds	323,439	
Eggs	Dozens	85,203,290	8,315,371
Poultry			9,525,252
Honey	Pounds	3,018,929	348,604
Wax	Pounds	69,258	
Animals sold			54,018,809
Animals slaughtered			9,765,879
Total			97,841,944

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of all milk sold or consumed and of butter and cheese made.

The value of animal products for the year 1899 was $97,841,944, of which amount 65.2 per cent represents the value of animals sold and animals slaughtered on farms; 18.2 per cent, that of poultry and eggs; 15.4 per cent, that of dairy produce; 0.8 per cent, that of wool, mohair, and goat hair; and 0.4 per cent, the value of honey and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

The value of animals sold and animals slaughtered on farms for the year 1899 was $63,784,688, or 39.5 per cent of the gross farm income. Atchison county is first in amount of sales, reporting $1,407,838 received by 1,610 farmers from the sale of live animals, and seven other counties of the state report sales amounting to more than a million dollars each. Of all farmers reporting live stock, 228,531, or 82.3 per cent, reported animals slaughtered, the average value per farm being $42.73; and 199,935, or 72.0 per cent, reported sales, the average receipts per farm being $270.18. In securing the reports of animals sold on farms, the enumerators were instructed to obtain from each farmer a statement of the amount received from the sale of live animals less the amount paid in 1899 for such animals purchased during the same year.

DAIRY PRODUCE.

Of the total value of dairy produce given in Table 16, 65.1 per cent represents the value of such produce consumed on farms, and 34.9 per cent the receipts from sales. Of the latter amount, $2,985,872 was received from the sale of 25,954,163 gallons of milk; $2,123,750, from 14,298,011 pounds of butter; $129,159, from 248,542 gallons of cream; and $17,459, from 245,092 pounds of cheese. The amount of milk produced in 1899 was 64,276,652 gallons greater than in 1889, a gain of 33.1 per cent. The amounts of cheese and butter made on farms increased, respectively, 12.1 per cent and 5.6 per cent in the same time.

POULTRY AND EGGS.

The total value of the products of the poultry industry in 1899 was $17,840,623. Of this amount, 53.4 per cent represents the value of poultry raised, and 46.6 per cent, that of eggs produced. There were 85,203,290 dozens of eggs reported in 1900, 60.3 per cent more than ten years before. Twenty-seven counties reported more than a million dozens of eggs each, Franklin county making the largest report.

WOOL.

The largest report of wool for the state was made in 1880. Between 1880 and 1890 there was a considerable decrease, but the census of 1900 indicates an increase of 2.6 per cent since 1890. This increase is probably more apparent than real, owing to the fact that in 1890 the fleeces of at least 277,627 sheep were omitted from the table but included in a general estimate of the wool shorn after the census enumeration. The average weight of fleeces increased, in that time, from 6.0 pounds to 6.1 pounds.

HONEY AND WAX.

In 1899 there were 3,018,929 pounds of honey and 69,258 pounds of wax reported, a decrease since 1890 of 32.8 per cent in honey and 8.5 per cent in wax.

HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses and dairy cows, the total number of these animals, and the average number per farm. In computing the averages presented, only those farms which report the kind of stock under consideration are included.

TABLE 17.—HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.			DAIRY COWS.		
	Farms reporting.	Number.	Average per farm.	Farms reporting.	Number.	Average per farm.
Total	255,522	967,037	3.8	240,140	765,386	3.2
White farmers	251,395	956,291	3.8	237,411	760,227	3.2

Miscellaneous	34,540	91,817	2.7	32,164	69,571	2.2

[1] Including "part owners" and "owners and tenants"

CROPS.

The following table gives the statistics of the principal crops grown in 1899:

TABLE 18.—ACREAGE, QUANTITIES, AND VALUES OF THE PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantity.	Value.
Corn	7,423,683	Bushels	208,844,870	$61,246,306
Wheat	2,056,219	Bushels	23,072,768	13,520,012
Oats	916,178	Bushels	20,545,350	4,669,185
Barley	1,727	Bushels	28,969	11,232
Rye	21,233	Bushels	220,338	103,192
Buckwheat	2,715	Bushels	21,480	12,079
Kafir corn	1,990	Bushels	38,497	12,836
Flax seed	100,952	Bushels	611,888	519,929
Clover seed		Bushels	58,737	220,759
Grass seed		Bushels	219,760	202,636
Hay and forage	3,481,506	Tons	4,326,896	20,467,501
Cotton	45,596	Bales	26,676	849,199
Cottonseed		Tons	[1] 5,593	65,059
Tobacco	4,361	Pounds	3,041,996	218,991
Hemp	10	Pounds	2,000	100
Hops	(2)	Pounds	383	57
Broom corn	10,219	Pounds	3,693,370	159,988
Peanuts	271	Bushels	6,679	6,407
Dry beans	4,376	Bushels	45,647	73,850
Dry pease	5,319	Bushels	54,763	66,701
Potatoes	93,915	Bushels	7,786,623	2,756,695
Sweet potatoes	9,844	Bushels	743,377	424,470
Onions	1,383	Bushels	259,272	155,877
Castor beans	5,622	Bushels	31,966	31,177
Miscellaneous vegetables	114,853			6,388,460
Maple sirup		Gallons	5,474	5,271
Maple sugar		Pounds	12,056	1,288
Sorghum cane	30,997	Tons	22,166	62,967
Sorghum sirup		Gallons	1,990,987	597,667
Small fruits	14,860			1,050,811
Orchard fruits	[3] 471,349	Bushels		[4] 2,944,175
Grapes	[3] 4,938	Centals	137,837	[5] 314,807
Figs		Pounds	550	20
Nuts				19,838
Forest products				4,442,131
Flowers and plants	181			409,890
Seeds	156			15,416
Nursery products	2,972			349,449
Miscellaneous	195			68,609
Total	14,827,620			121,455,026

[1] Exclusive of 7,760 tons, valued at $76,258, sold in seed cotton and included with the cotton.
[2] Less than 1 acre.
[3] Estimated from number of trees or vines.
[4] Including value of cider and vinegar.
[5] Including value of raisins, wine, etc.

Of the total value of crops, cereals, including Kafir corn, contributed 65.5 per cent; hay and forage, 16.8 per cent; vegetables, including potatoes, sweet potatoes, and onions, 7.2 per cent; fruits and nuts, 3.6 per cent; forest products, 3.7 per cent; and all other products, 3.2 per cent.

The average values per acre of the various crops are as follows: Flowers and plants, $2,265; nursery products, $118; small fruits, $69; tobacco, $50; miscellaneous vegetables, $47; sweet potatoes, $43; potatoes, $29; sorghum cane and sirup, $21; cotton, $20; broom corn, $16; dry beans and pease, $14; hay and forage, $6; castor beans, $6; and flaxseed, $5. The crops yielding the highest average returns per acre were grown upon highly improved land. Their production required a relatively great amount of labor and large expenditures for fertilizers.

CEREALS.

The following table is a statement of the changes in cereal production since 1849:

TABLE 19.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899.

PART 1.—ACREAGE.

YEAR.[1]	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	1,727	2,715	7,423,683	916,178	21,233	2,056,219
1889	1,504	2,802	6,072,121	1,676,706	24,283	1,946,785
1879	6,472	5,463	5,588,266	968,473	46,484	2,074,394

PART 2.—BUSHELS PRODUCED.

YEAR.	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	28,969	21,480	208,844,870	20,545,350	220,338	23,072,768
1889	34,863	28,440	196,999,016	39,820,149	308,807	30,113,821
1879	123,031	67,640	202,414,413	20,670,958	535,426	24,966,627
1869	269,240	36,252	66,034,075	16,578,313	559,532	14,315,926
1859	228,502	182,292	72,892,157	3,680,870	293,262	4,227,586
1849	9,631	23,641	36,214,637	5,278,079	44,268	2,981,652

[1] No statistics of acreage were secured prior to 1879.

The total area devoted to cereals in 1879 was 8,689,551 acres; in 1889, 9,724,201 acres; and in 1899, 10,421,755 acres. This was a gain in the last decade of 7.2 per cent. The increases in area devoted to cereals in the past decade were: Corn, 22.3 per cent; barley, 14.8 per cent; and wheat, 5.6 per cent. The decreases were: Oats, 45.4 per cent; rye, 12.6 per cent; and buckwheat, 3.1 per cent. The total number of bushels produced in 1899 was 252,733,775, or nearly six times the number produced in 1849, which was 44,551,808.

Of the total area in cereals in 1899, 71.2 per cent was devoted to corn; 19.7 per cent, to wheat; 8.8 per cent, to oats; 0.2 per cent, to rye; and 0.1 per cent, to buckwheat and barley.

The operators of 259,420 farms, or 91.1 per cent of the total number in the state, reported corn; 89,941, or 31.6 per cent, reported wheat; and 83,411, or 29.3 per cent, reported oats. Nodaway county leads in the acreage and production of corn, oats, and barley. Franklin county produced the most wheat, and Clark county the most buckwheat and rye.

HAY AND FORAGE.

In 1900, 176,893 farmers, or 62.1 per cent of the total number in the state, reported hay or forage crops. Exclusive of cornstalks and corn strippings, they obtained an average yield of 1.17 tons per acre. The total area in hay and forage for 1899 was 3,481,506 acres, or 21.3 per cent greater than ten years before.

In 1899 the acreages and yields of the various kinds of hay and forage were as follows: Wild, salt, and prairie grasses, 167,959 acres and 196,288 tons; millet and Hungarian grasses, 166,709 acres and 230,995 tons; alfalfa or lucern, 2,239 acres aud 5,409 tons; clover, 377,228 acres and 493,364 tons; other tame and cultivated grasses, 2,563,365 acres and 2,829,485 tons; grains cut green for hay, 124,515 acres and 151,967 tons; crops grown for forage, 79,491 acres and 154,691 tons; cornstalks and corn strippings, 258,552 acres and 264,697 tons.

In Table 18 the production of cornstalks and corn strippings is included under "hay and forage" but the acreage is a part of that given for "corn," as the forage secured was only an incidental product of the corn crop.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 may be seen in the following table:

TABLE 20.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900	1890	1899	1889
Apples	20,040,399	8,150,442	6,496,436	8,698,170
Apricots	16,190	6,250	583	1,035
Cherries	679,985	381,185	62,708	88,444
Peaches	4,557,365	1,999,474	61,006	1,667,789
Pears	548,702	84,741	58,449	58,683
Plums and prunes	745,187	152,686	111,603	40,338

Of the farmers of the state, 119,605, or 42.0 per cent, report orchard fruits in 1900. Since 1890 there has been a large general increase throughout the state in the number of fruit trees. Apple trees increased 145.9 per cent; peach trees, 127.9 per cent; apricot trees, 159.0 per cent; and cherry trees, 78.4 per cent. There are more than six times the number of pear trees reported in 1890, and nearly five times as many plum and prune trees. The largest gains in the numbers of apple and peach trees have been in the southern part of the state.

Of all fruit trees in 1900, 75.2 per cent were apple trees; 17.1 per cent, peach trees; 2.8 per cent, plum and prune trees; 2.1 per cent, pear trees; 2.5 per cent, cherry trees; 0.3 per cent, apricot and unclassified fruit trees. The latter class, which is not included in the table, numbered 69,973, and yielded 14,716 bushels of fruit.

The value of orchard products, given in Table 18, includes the value of 29,545 barrels of cider, 10,050 barrels of vinegar, and 1,327,660 pounds of dried and evaporated fruits. Comparisons of yields or of their values, when made by decades only, are of little significance, as the yield of any given year is largely dependent upon the nature of the season.

All counties of the state reported fruit trees, and a majority show marked increases since 1890. The southern counties reported the largest numbers of apple and peach trees.

COTTON.

The following table is a statement of the changes in cotton production since 1859:

TABLE 21.—ACREAGE AND PRODUCTION OF COTTON: 1859 TO 1899.

YEAR.	ACREAGE.		PRODUCTION.		
	Total.	Per cent of increase.	Commercial bales.	Pounds.	Per cent of increase.
1899	45,596	[1]20.4	25,576	12,865,944	70.1
1889	57,260	78.3	15,856	7,563,312	[1]17.8
1879	32,116	....	20,318	9,204,054	1,602.0
1869	....	....	....	540,764	[1]97.0
1859	....	....	....	18,328,660	....

[1] Decrease.

In 1899, 4,691 farmers devoted an area of 45,596 acres to the production of cotton, an average of 9.7 acres per farm. From this land was obtained 12,865,944 pounds of cotton, an average of 2,743 pounds per farm and 282 pounds per acre. The total value of this crop, including the value of the cottonseed, was $904,258, an average of $192.76 per farm, and $19.83 per acre.

The counties which devoted the largest area to cotton are Dunklin, Pemiscot, Stoddard, New Madrid, and Ozark, ranking in the order named, and reporting 91.2 per cent of the total acreage. Dunklin alone reported 56.3 per cent of the total acreage. With the exception of Ozark, these counties adjoin, and are located in the extreme southeastern corner of the state.

VEGETABLES.

The value of all vegetables grown in the state in 1899, including potatoes, sweet potatoes, and onions, was $8,725,502. Aside from the land devoted to potatoes, sweet potatoes, and onions, 114,853 acres were used in the growing of miscellaneous vegetables. Of this area the products of 74,663 acres were not reported in detail. Of the remaining 40,190 acres, concerning which detailed reports were received, 14,487 acres were devoted to watermelons; 10,277, to tomatoes; 5,963, to cabbages; 4,733, to sweet corn; 2,113, to muskmelons; 1,293, to cucumbers; 278, to pumpkins; 187, to beans; 129, to lettuce; 127, to pease; 106, to spinach; and 497, to other vegetables.

SMALL FRUITS.

The total area used in the cultivation of small fruits in 1899 was 14,860 acres, distributed among 48,517 farms. The value of the fruits grown was $1,050,811, an average of $22 per farm. The acreages and productions of the various berries were as follows: Strawberries, 7,498 acres and 13,018,460 quarts; blackberries and dewberries, 4,441 acres and 5,121,860 quarts; raspberries and Logan berries, 1,660 acres and 1,940,850 quarts; gooseberries, 731 acres and 865,870 quarts; currants, 194 acres and 223,730 quarts; and other berries, 336 acres and 314,150 quarts.

TOBACCO.

According to the census of 1850 Missouri produced 17,113,784 pounds of tobacco. The census of 1860 shows a gain of 7,972,412 pounds, or 46.6 per cent. In every decade since 1860 there has been a greater or less decrease in the crop in the state. Between 1860 and 1870 there was a decrease of 12,765,713 pounds, or 50.9 per cent. Between 1870 and 1880 there was a decline of 2.5 per cent, and between 1880 and 1890, a decline of 2,590,834 pounds, or 21.6 per cent.

The present census shows that in 1899 tobacco was grown in Missouri by 10,475 farmers, who obtained from 4,361 acres a yield of 3,041,996 pounds, valued at $218,991. This was a decrease in area for the last decade of 6,989 acres, or 61.6 per cent, and in production, of 6,382,827 pounds, or 67.7 per cent. The average area for each farm on which tobacco was grown was a little over two-fifths of an acre. Tobacco was grown in 114 counties of the state, the area ranging from 1 acre in New Madrid county to 751 acres in Chariton county.

SORGHUM CANE.

The present census shows that in 1899 sorghum cane was raised by 48,951 farmers on 30,977 acres of land, an average of 0.6 acre for each farm reporting. From this area they sold 22,166 tons of cane for $62,967, and from the remaining product manufactured 1,990,987 gallons of sirup, valued at $597,657. There was a decrease in acreage in ten years of 14.6 per cent. The crop reached its highest point in 1879, when a production of 4,129,595 gallons of sirup was reported.

FLAX.

Flax was grown in 1899 by 5,730 farmers, or 2.0 per cent of the total number in the state. Since 1889 the area devoted to this crop has increased from 56,421 to 100,952 acres, or 78.9 per cent, and the yield, in bushels of seed, from 450,831 to 611,888, or 35.7 per cent. The total value of the crop was $519,929. The average yield per acre was 8.0 bushels of seed in 1889, and 6.1 in 1899. The average acreage per farm devoted to this crop was 17.6, and the average value of crop per farm, $90.74.

Almost the entire crop was grown near the western border south of the Missouri River. The leading counties in both acreage and production are Bates, Cass, Barton, Vernon, Johnson, and Henry, ranking in the order named.

CASTOR BEANS.

Castor beans were grown in 1899 by 495 farmers, who devoted to their cultivation 5,622 acres and secured therefrom a product of 31,966 bushels, an average of 5.7 bushels per acre, and valued at $31,177. Of the total acreage, 97.2 per cent was reported from the southwestern counties of Vernon, Barton, and Cedar, ranking in the order named.

BROOM CORN.

In 1899, 10,219 acres, reported by 1,978 farmers, produced 3,693,370 pounds of broom corn, valued at $159,988. This is a gain in product, since 1890, of 2,642,231 pounds, or 251.4 per cent, and an increase of 290.3 per cent in acreage. More than half of the total product was grown in the four west central counties of Henry, Bates, Benton, and St. Clair.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 181 acres, and the value of products sold therefrom was $409,890. These flowers and plants were grown by 270 farmers and florists. Of this number, 183 made commercial floriculture their principal business. These 183 proprietors had invested, in the aggregate, $1,088,436, of which $558,775 represents the value of land and improvements other than buildings; $492,200, the value of buildings; $29,240, that of implements and machinery; and $8,221, that of live stock. Their sales of flowers and plants amounted to $400,136, and they secured other products valued at $18,088. They expended for labor $86,720, and for fertilizers, $4,181.

In addition to the 183 principal florists' establishments, 1,088 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 1,988,860 square feet, making, with the 1,137,540 square feet belonging to the florists' establishments, a total of 3,126,400 square feet of land under glass.

NURSERIES.

The total value of nursery products sold in 1899 was $349,449, reported by the operators of 259 farms and nurseries. Of this number, 116 derived their principal income from the nursery business. They had 9,650 acres of land, valued at $659,770; buildings worth $167,125; implements and machinery, $23,640; and live stock, $21,605. Their total income, exclusive of products fed to live stock, was $364,356, of which $333,366 represents the value of nursery stock, and $30,990, that of other products. The expenditure for labor was $91,348, and for fertilizers, $2,715.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899 was $9,803,610, an average of $34 per farm. The average expenditure was $787 for nurseries, $474 for florists' establishments, $70 for fruit farms, $63 for vegetable farms, $54 for dairy farms, $38 for live-stock farms, $31 for hay and grain farms, $24 for cotton farms, $22 for tobacco farms, and $14 for sugar farms. "Managers" expended on an average, $266; "owners," $37; "cash tenants," $34; and "share tenants," $16. White farmers expended $35 per farm, and colored farmers, $13.

Fertilizers purchased in 1899 cost $370,630, an average of $1.30 per farm, and more than five times the amount expended in 1890. The average expenditure was $23 for nurseries and florists' establishments, $6 for vegetable farms, $4 for fruit farms, and $1 for hay and grain, live-stock, dairy, tobacco, and sugar farms.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 225. WASHINGTON, D. C. JULY 3, 1902.

AGRICULTURE.

MISSISSIPPI.

Hon. William R. Merriam,
Director of the Census.

Sir: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the state of Mississippi, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It includes also the house in which the farmer resides and all other buildings used by him in connection with his farming operations.

The farms of Mississippi, June 1, 1900, numbered 220,803, and were valued at $152,007,000. Of this amount, $37,150,340, or 24.4 per cent, represents the value of buildings, and $114,856,660, or 75.6 per cent, the value of land and improvements other than buildings. On the same date the value of farm implements and machinery was $9,556,805, and of live stock, $42,657,222. These values, added to that of farms, give $204,221,027, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $102,492,283, of which amount $17,608,507, or 17.2 per cent, represents the value of animal products, and $84,883,776, or 82.8 per cent, the value of crops, including forest products. The total value of farm products for 1899 exceeds that for 1889 by $29,149,288, or 39.7 per cent.

The "gross farm income" is obtained by deducting from the total value of farm products the value of the products fed to live stock on the farms of the producers. In 1899 the reported value of products fed was $11,748,625, leaving $90,743,658 as the gross farm income. The ratio which this amount bears to the "total value of farm property" is referred to in this bulletin as the "percentage of gross income upon investment." For Mississippi in 1899 it was 44.4 per cent.

As no reports of expenditure for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

The statistics presented in this bulletin will be treated in greater detail in the report on agriculture in the United States. The present publication is designed to present a summarized advance statement for Mississippi.

Very respectfully,

L. G. Powers.

Chief Statistician for Agriculture.

AGRICULTURE IN MISSISSIPPI.

GENERAL STATISTICS.

Mississippi has a total land area of 46,340 square miles, or 29,657,600 acres, of which 18,240,736 acres, or 61.5 per cent, are included in farms.

From the northeast corner of Mississippi, where the land is slightly rugged, the surface gradually slopes, with many undulations, west to the Mississippi River and south to the Gulf of Mexico. The broad, low ridge thus formed extends nearly north and south through the state, and divides the waters which flow into the Mississippi from the affluents of the Tombigbee, Pearl, and Pascagoula rivers. On this ridge are large tracts of arable land, much of which is under cultivation, while other portions are covered by forests. To the west is doubtless the most desirable farm land of the state, extending from Vicksburg to the north state line, and including all that portion between the Mississippi and Yazoo rivers. To the east are broad, gently rolling prairie lands, exceedingly fertile, yielding large crops of corn and cotton.

The state has several varieties of soil, most of which are fertile and productive. Among these are the brown loam of the central table-land; the rich, black, calcareous soil of the prairie region; the sandy loam with a clayey or sandy subsoil, south of the central ridge; and the yellow loam of the northeast. All of these except the last two are unusually rich, and may easily be kept in a high state of cultivation without the use of fertilizers.

NUMBER AND SIZE OF FARMS.

The following table gives, by decades since 1850, the number of farms, the total and average acreage, and the per cent of farm land improved.

Table 1.—FARMS AND FARM ACREAGE: 1850 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	220,803	18,240,736	7,594,428	10,646,308	82.6	41.6
1890	144,318	17,572,547	6,849,390	10,723,157	121.8	39.0
1880	101,772	15,855,462	5,216,937	10,638,525	155.8	32.9
1870	68,023	13,121,113	4,209,146	8,911,967	192.9	32.0
1860	42,840	15,839,684	5,065,755	10,773,929	369.7	32.0
1850	33,960	10,490,419	3,444,358	7,046,061	308.9	32.8

The number of farms reported, June 1, 1900, was more than six times as great as the number reported in 1850 and 53.0 per cent greater than in 1890. The total acreage, however, has gained only 73.9 per cent since 1850, and 3.8 per cent since 1890, showing that the number of farms has increased faster than the total acreage, involving a general decrease in the average size of farms. The percentage of farm land improved is somewhat greater than ten years ago, but little change being shown for any decade before 1880.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1850.

Table 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY AND OF PRODUCTS: 1850 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$204,221,027	$152,007,000	$9,556,805	$42,657,222	$102,492,283
1890	167,328,457	127,423,157	5,968,865	33,936,435	73,342,995
1880	122,016,268	92,844,915	4,885,636	24,285,717	63,701,844
1870[2]	116,113,447	81,716,576	4,456,633	29,940,238	[3] 73,137,953
1860	241,478,571	190,760,367	8,826,512	41,891,692	....
1850	79,905,223	54,738,634	5,762,927	19,403,662	....

[1] For year preceding that designated.
[2] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other years they must be diminished one-fifth.
[3] Includes betterments and additions to live stock.

The remarkable growth of agriculture in the decade from 1850 to 1860, the disastrous effects of the Civil War, and the subsequent partial recovery of the state, are interesting facts shown in the above table. The total value of farm property is even now less than it was in 1860, but the value of implements and machinery and of live stock has reached the highest point in the history of the state.

The gain in the last decade in the total value of farm property was $36,892,570, or 22.0 per cent. The value of land, improvements, and buildings increased $24,583,843, or 19.3 per cent; that of implements and machinery, $3,587,940, or 60.1 per cent; and that of live stock, $8,720,787, or 25.7 per cent. The value of the farm products of 1899 was 39.7 per cent greater than the value reported for 1889. A portion of this increase and of that shown for implements and machinery, is doubtless the result of a more detailed enumeration in 1900 than in previous years.

COUNTY STATISTICS.

Table 3 gives an exhibit of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS, AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH GROSS INCOME (PRODUCTS OF 1899 NOT FED TO LIVE STOCK), AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Value of products not fed to live stock.	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.
The State	220,803	211,299	18,240,736	7,594,428	$114,856,660	$37,150,340	$9,556,805	$42,657,222	$90,743,658	$3,917,256	$932,098

Increases in the number of farms in the last decade are reported for all counties except Issaquena. The total acreage of farm land increased in two-thirds of the counties, while the remaining counties show decreases. The decrease in improved acreage reported for nearly one-fifth of the counties is due to a more intensive cultivation of smaller areas of farm land, and to the use of a more strict definition of the term "improved" by the Twelfth than by any preceding census. The average size of farms for the state is 82.6 acres, ranging from 38.7 acres in Washington county to 232.3 acres in Jackson county. The average size of farms is, as a rule, largest in the southern counties, and smallest in the northern counties having the greatest acreages in cotton.

Between 1890 and 1900 the total value of farms decreased in nearly one-sixth of the counties, these, with one exception, being in the northern part of the state. For the state, the average value of farms was $688.43. Issaquena alone reported a decrease in the value of implements and machinery, and every county but De Soto, Issaquena, and Monroe reported a gain in the value of live stock.

Very few counties reported large average expenditures per farm for labor in 1899. The amount varied from less than $1 per farm in Benton county to over $70 per farm in Tunica county. In the counties reporting low averages, cultivation was not intensive and farmers exchanged labor or paid in produce. One-third of the counties, usually those reporting large expenditures in 1889, showed a decrease in the total expenditures for fertilizers in 1899.

FARM TENURE.

Table 4 is an exhibit of farm tenure for 1880, 1890, and 1900, showing the number and per cent of farms operated by owners and by tenants. Tenants are divided into two groups: "Cash tenants," who pay a rental in cash or in a stated amount of labor or farm produce, and "share tenants," who pay as rental a stated share of the products.

In Table 5 the tenure of farms in 1900 is given by race of farmer, and "farms operated by owners" are subdivided into groups designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it and the other, or others, owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive for their supervision and other services a fixed salary from the owners.

Table 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 TO 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.
1900	220,803	82,951	70,699	67,153	37.6	32.0	30.4
1890	144,318	68,058	30,366	45,894	47.2	21.0	31.8
1880	101,772	57,214	17,440	27,118	56.2	17.1	26.7

[1] Including "part owners," "owners and tenants," and "managers."

Table 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

PART 1.—NUMBER OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	220,803	75,981	5,431	609	930	70,699	67,153
White	92,124	57,613	2,972	463	823	13,505	16,748
Colored	128,679	18,368	2,459	146	107	57,194	50,405
Indian	328	102	2	....	....	50	174
Negro	128,351	18,266	2,457	146	107	57,144	50,231

PART 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	100.0	34.4	2.5	0.3	0.4	32.0	30.4
White	100.0	62.5	3.2	0.5	0.9	14.7	18.2
Colored	100.0	14.3	1.9	0.1	0.1	44.4	39.2

In the period from 1880 to 1900 the total number of farms increased 117.0 per cent, and in the last decade, 53.0 per cent. Since 1890, the number of farms operated by owners has increased 21.9 per cent; by cash tenants, 132.8 per cent; and by share tenants, 46.3 per cent. The percentages shown in Table 4 indicate that the number of farms operated by owners has not increased so rapidly since 1880 as the number operated by tenants.

In 1900, 41.7 per cent of the farms of the state were operated by white farmers and 58.3 per cent by colored farmers. Of the white farmers, 66.2 per cent owned all or a part of the farms they operated and 33.8 per cent operated farms owned by others. The corresponding percentages for colored farmers are 16.3 and 83.7, respectively.

In 1890, 39.8 per cent of all tenants were cash tenants, and in 1900, 51.3 per cent. Generally in the counties where most of the farmers are white, share tenants outnumber cash tenants; but in those counties where colored farmers predominate, the proportion of cash tenants is greater.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the number conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

TABLE 6.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	220,803	82.6	18,240,736	100.0	$204,221,027	100.0
White	92,124	133.9	12,337,537	67.6	117,733,593	57.7
Negro	128,351	45.9	5,886,075	32.3	86,390,974	42.3
Indian	328	52.2	17,124	0.1	96,460	(1)
Owners	75,981	148.3	11,265,023	61.8	100,196,000	49.1
Part owners	5,431	111.0	602,674	3.3	5,808,863	2.8
Owners and tenants	609	148.0	90,130	0.5	694,683	0.3
Managers	930	555.0	516,176	2.8	8,756,607	4.3
Cash tenants	70,699	50.1	3,541,828	19.4	53,739,987	26.3
Share tenants	67,153	33.1	2,224,905	12.2	35,024,887	17.2

(1) Less than one-tenth of 1 per cent.

TABLE 7.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY RACE OF FARMER AND BY TENURE.

RACE OF FARMER, AND TENURE.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900.					Per cent of gross income on total investment in farm property.
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	
The State	$520	$168	$44	$193	$411	44.4
White	649	277	68	284	469	36.7
Negro	429	91	26	128	370	54.9
Indian	164	50	12	68	182	61.8
Owners	658	291	71	299	486	36.8
Part owners	563	207	53	247	418	39.0
Owners and tenants	560	224	55	302	455	39.8
Managers	6,048	1,582	522	1,264	1,640	17.4
Cash tenants	470	104	31	155	403	52.9
Share tenants	337	74	17	94	318	60.9

In 1900, 32.4 per cent of the total acreage was operated by colored farmers, while about one-tenth was actually owned by them. The value of the farms operated by colored farmers was 42.3 per cent of the total, although the value of farms owned by them was only about one-twelfth. The large per cent of gross income shown for colored farmers in Table 7 is due to the smaller size and consequent more intensive cultivation of their farms and to the lower value of their farm property, or capital invested. It is due also to the systems of tenure widely used in Southern states, under which the most fertile areas of the large plantations are rented in small tracts to negroes and appear as the farms of colored tenants, while the large unimproved areas, on which few products are raised and which contain the valuable buildings of the plantation, are retained by the proprietor and appear as the farms of white owners.

Farms conducted by share tenants have the smallest average area, 33.1 acres, and those of managers, the largest, 555.0 acres. These latter farms, as a rule, are favorably located and highly improved, many being large cotton plantations, and the average values of the various forms of farm property, shown in Table 7, are much larger for this class than for any other group classified by tenure. The ratio which the gross income of these farms bears to the total value of farm property is, however, smaller than for the other groups, due to the high average valuation of farm property or capital invested.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	220,803	82.6	18,240,736	100.0	$204,221,027	100.0
Under 3 acres	499	2.2	1,085	(1)	370,227	0.2
3 to 9 acres	6,242	6.9	43,018	0.2	2,299,814	1.1
10 to 19 acres	35,529	15.0	532,517	2.9	15,016,084	7.4
20 to 49 acres	85,934	31.0	2,667,004	14.6	51,540,352	25.2
50 to 99 acres	39,469	71.1	2,806,402	15.4	33,696,365	16.5
100 to 174 acres	31,380	136.6	4,287,219	23.5	35,154,413	17.2
175 to 259 acres	10,331	210.2	2,171,850	11.9	17,480,208	8.6
260 to 499 acres	8,099	337.6	2,734,103	15.0	21,027,518	10.3
500 to 999 acres	2,461	636.4	1,566,195	8.6	13,983,622	6.8
1,000 acres and over	859	1,666.3	1,431,343	7.9	13,652,424	6.7

(1) Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUE PER FARM OF— Farm property, June 1, 1900.					Per cent of gross income on total investment in farm property.
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	
The State	$520	$168	$44	$193	$411	44.4
Under 3 acres	145	382	22	193	177	23.8
3 to 9 acres	159	120	15	74	135	36.6
10 to 19 acres	250	73	15	85	246	58.3
20 to 49 acres	361	90	25	124	361	60.2
50 to 99 acres	461	150	42	201	453	53.1
100 to 174 acres	570	226	56	268	477	42.6
175 to 259 acres	869	362	90	371	573	33.9
260 to 499 acres	1,382	552	136	526	724	27.9
500 to 999 acres	3,409	1,072	305	896	1,190	20.9
1,000 acres and over	10,813	2,347	698	2,035	2,911	18.3

The total acreage is greatest for the group of farms containing 100 to 174 acres, but the group containing from 20 to 49 acres reports the greatest value of farm property.

For the group of farms of less than 3 acres, the average values given in Table 9 are relatively high, as this group contains many of the florists' establishments of the state, and a number of city dairies. It should be borne in mind that the income from these industries depends less upon the acreage of land used, than upon the amount of capital invested in buildings, implements, and live stock, and the expenditures for labor and fertilizers.

The average gross incomes per acre for the various groups classified by area are as follows: Farms under 3 acres, $81.36; 3 to 9 acres, $19.57; 10 to 19 acres, $16.44; 20 to 49 acres, $11.62; 50 to 99 acres, $6.37; 100 to 174 acres, $3.49; 175 to 259 acres, $2.73; 260 to 499 acres, $2.14; 500 to 999 acres, $1.87; 1,000 acres and over, $1.75.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading features of the statistics relating to farms classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop and constitutes at least 40 per cent of the total value of products not fed to live stock, the farm is classified as a "hay and grain" farm; if vegetables are the leading crop, constituting 40.0 per cent of the value of products, it is a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive 40.0 per cent of their income from any one class of products. Farms with no income in 1899 are classified according to the agricultural operations upon other farms in the same locality.

TABLE 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	220,803	82.6	18,240,736	100.0	$204,221,027	100.0

Nursery products	3,326	1,090	108	223	1,941	40.9
Miscellaneous	507	236	56	246	375	36.0

The importance of cotton growing in this state is shown by the fact that cotton plantations comprise 58.8 per cent of the total area in farms and 65.1 per cent of the total value of farm property.

For the several classes of farms the average values per acre of the products not fed to live stock are as follows: Farms deriving their principal income from flowers and plants, $388.47; nursery products, $15.52; tobacco, $6.60; cotton, $6.47; fruits, $5.88; vegetables, $5.83; rice, $3.23; hay and grain, $2.95; sugar, $2.94; miscellaneous, $2.88; dairy produce, $2.51; and live stock, $2.36.

The wide variations shown in the averages and in the percentages of gross income are largely due to the fact that in computing gross income no deduction is made for expenditures. For florists' establishments, nurseries, and market gardens the average expenditures for such items as labor and fertilizers represent a far larger percentage of the gross income than in the case of "hay and grain," "live-stock," or "miscellaneous" farms. Were it possible to present the average net incomes the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by the reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.

$2,500 and over	6,903	1,802	618	1,493	4,146	38.3

The absence of income in the first group is due in part to the fact that the enumerators could not always secure complete reports for farms where changes in ownership or tenancy had occurred shortly prior to the date of enumeration. The persons in charge of such farms on June 1, 1900, could not always give definite information concerning the products of the preceding year. The same statement is true, also, of some of the farms with reported incomes of less than $100. To this extent the reports fall short of giving a complete statement of farm income in 1899. Other farms with small reported incomes are doubtless the country homes of city merchants and professional men, who derive their principal incomes from other than agricultural pursuits.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the census of 1900. The age grouping of neat cattle was determined by their present and prospective relation to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits a very close comparison with the figures published in previous census reports.

Table 14 presents a summary of live-stock statistics.

TABLE 14.—NUMBER AND VALUE OF DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age in years.	ON FARMS.			NOT ON FARMS.
		Number.	Value.	Average value.	Number.
Calves	Under 1	238,601	$1,157,630	$4.85	9,935

Mules	1 and under 2	12,286	606,409	49.36	154
Mules	2 and over	194,392	13,302,252	68.43	4,132
Asses and burros	All ages	1,773	216,609	122.17	244
Lambs	Under 1	76,162	107,166	1.41	759
Sheep (ewes)	1 and over	162,188	289,401	1.78	1,598
Sheep (rams and wethers).	1 and over	74,282	138,378	1.86	762
Swine	All ages	1,290,498	2,963,573	2.30	23,126
Goats	All ages	55,388	45,594	0.82	1,895
Fowls:[1]					
Chickens[2]	....	5,194,856	1,655,319	....	....
Turkeys	....	189,698			
Geese	....	357,963			
Ducks	....	95,668			
Bees (swarms of)	....	95,257	158,603	1.66	....
Value of all live stock.	....	....	42,657,222	....	....

[1] The number reported is of fowls over three months old. The value is for all, old and young.
[2] Including Guinea fowls.

The total value of live stock on farms, June 1, 1900, was $42,657,222, of which amount 33.1 per cent represents the value of mules; 25.5 per cent, that of horses; 15.0 per cent, that of dairy cows; 13.3 per cent, that of other neat cattle; 6.9 per cent, that of swine; 3.9 per cent, that of poultry; 1.3 per cent, that of sheep; and 1.0 per cent, that of all other live stock.

No reports were secured of the value of live stock not on farms, but it is probable that such animals have higher average values than those on farms. Allowing the same averages, however, the value of the domestic animals not on farms is $1,740,471. Exclusive of poultry and bees not on farms, the total value of the live stock in the state is approximately $44,397,693.

CHANGES IN LIVE STOCK ON FARMS.

The following table shows the change since 1850 in the number of the most important domestic animals:

TABLE 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS: 1850 TO 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	299,318	574,038	229,311	216,032	236,470	1,290,498
1890	310,159	604,619	155,050	156,755	451,779	1,163,141
1880	268,178	449,157	112,309	129,778	287,694	1,151,818
1870	173,899	327,176	90,221	85,886	232,732	814,381
1860	207,646	522,263	117,571	110,723	352,632	1,532,768
1850	214,231	519,739	115,460	54,547	304,929	1,582,734

[1] Lambs not included.

The census of 1900 shows an increase in the number of dairy cows of 39.7 per cent since 1850, but a decrease of 3.5 per cent in the last decade. The apparent decrease was due to the restriction in 1900 of the term "dairy cows" to those "kept for milk" exclusively, while many cows which were milked at some time in the year were included among the 85,629 "cows and heifers not kept for milk." The increase in all dairy products confirms this statement.

"Other neat cattle" show an increase in number of 10.4 per cent since 1850, and a decrease of 5.1 per cent since 1890. The number of horses has increased 98.6 per cent in the last half century, and that of mules, nearly four times. Sheep have decreased 22.4 per cent, and swine, 18.5 per cent. In the last decade the number of horses has increased 47.9 per cent; mules, 37.8 per cent; and swine, 10.9 per cent; while sheep have decreased 47.7 per cent in the same time.

In comparing the poultry report of 1900 (see Table 14) it should be borne in mind that in 1900 the enumerators were instructed to report no fowls under three months old, while in 1890 no such restriction was made. Compared with the figures for 1890, the present census shows an increase of 50.1 per cent in the number of ducks reported, and decreases in the number of other fowls as follows: Geese, 24.6 per cent; chickens, 7.8 per cent; and turkeys, 2.4 per cent.

ANIMAL PRODUCTS.

Table 16 is a summarized statement of the animal products of 1899.

TABLE 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS, IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	779,310	$144,758
Mohair and goat hair	Pounds	268	84
Milk	Gallons	[1] 97,030,385	
Butter	Pounds	18,881,236	[2] 6,064,513
Cheese	Pounds	28,572	
Eggs	Dozens	18,942,070	1,871,765
Poultry			2,387,484
Honey	Pounds	1,048,490	113,021
Wax	Pounds	49,170	
Animals sold			2,208,466
Animals slaughtered			4,818,416
Total			17,608,507

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of all milk sold or consumed and of butter and cheese made.

The value of the animal products of the state in 1899 was $17,608,507, of which amount 39.9 per cent represents the value of animals sold and animals slaughtered on farms; 34.4 per cent, that of dairy products; 24.2 per cent, that of poultry and eggs; 0.8 per cent, that of wool, mohair, and goat hair; and 0.7 per cent, that of honey and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

The value of animals sold and animals slaughtered on farms, $7,026,882, was 7.7 per cent of the gross farm income. Of all farmers reporting domestic animals, 138,390, or 65.9 per cent, reported animals slaughtered, the average value per farm being $34.82; and 52,189, or 24.8 per cent, reported sales of live animals, the average receipts per farm being $42.32.

DAIRY PRODUCE.

In 1899 the proprietors of 2,965 farms, or 1.3 per cent of the farms of the state, derived their principal income from the sale of dairy produce. The production of milk in 1899 was 46,227,014 gallons greater than in 1889, the gain being 91.0 per cent. The quantity of butter made on farms increased 45.4 per cent in the same time, and that of cheese nearly six times.

Of the $6,064,513 given in Table 16 as the value of dairy produce, $5,334,225, or 88.0 per cent, represents the value of such produce consumed on farms, and $730,288, or 12.0 per cent, the receipts from sales. Of the latter amount, $443,956 was received from the sale of 2,654,703 pounds of butter; $279,968, from 2,041,443 gallons of milk; $4,864, from 8,191 gallons of cream; and $1,500, from 11,192 pounds of cheese.

POULTRY AND EGGS.

Of the $4,259,249 given as the value of poultry products, $2,387,484, or 56.1 per cent, represents the value of poultry raised, and $1,871,765, or 43.9 per cent, the value of eggs produced. There were 18,942,070 dozen eggs produced in 1899, a gain of 66.3 per cent since 1889. This tends to confirm the statement made in the discussion of Table 15, that the apparent decrease in the numbers of fowls is due to a difference in methods of enumeration.

WOOL.

Perry county leads in the production of wool, with Pearl River second. The production of wool increased in the forty years preceding 1890, with the exception of the decade 1860 to 1870, but in 1900 both sheep and wool showed marked decreases, that of wool for the last decade being 24.9 per cent. This decrease was probably more marked than the percentage indicates, as the fleeces of at least 76,843 sheep were omitted from the tables in 1900, but included in a general estimate of wool shorn after the census enumeration. The average weight of fleeces increased from 2.8 pounds in 1889 to 3.1 pounds in 1900.

HONEY AND WAX.

In 1890, 822,673 pounds of honey and 21,962 pounds of wax were reported, while in 1900 there were 1,048,490 pounds of honey and 49,170 pounds of wax. Yazoo, Attala, Copiah, Bolivar, and Lauderdale counties, ranking in the order named, lead in apiarian products.

HORSES, MULES, AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses, mules, and dairy cows, and the average number of these animals per farm. In computing the averages presented, only those farms which report the kind of live stock under consideration are included.

TABLE 17.—HORSES, MULES, AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.		MULES.		DAIRY COWS.	
	Farms reporting.	Average per farm.	Farms reporting.	Average per farm.	Farms reporting.	Average per farm.

Cotton	85,996	1.7	94,402	1.7	93,061	1.9
Miscellaneous[2]	26,328	1.9	16,208	1.9	30,897	2.4

[1] Including "part owners" and "owners and tenants."
[2] Including tobacco farms, rice farms, sugar farms, florists' establishments, and nurseries.

In Mississippi, as in all states where much of the farm labor is performed by negroes, and where cotton is a staple crop, large numbers of mules are used as work animals. If the numbers of horses and mules be combined, the average number of work animals per farm compares favorably with the corresponding figures for the more intensively cultivated farms of New England.

CROPS.

The following table gives the statistics of the principal crops grown in 1899:

TABLE 18.—ACREAGES, QUANTITIES, AND VALUES OF THE PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantity.	Value.
Corn	2,276,313	Bushels	38,789,920	$18,873,934
Wheat	6,447	Bushels	37,257	30,743
Oats	87,066	Bushels	862,805	383,633
Barley	32	Bushels	330	203

Total	5,611,114			84,883,776

[1] Exclusive of 14,137 tons, valued at $149,145, sold in seed cotton, and included with the cotton.
[2] Less than one acre.
[3] Sold as cane.
[4] Estimated from number of vines or trees.
[5] Including value of raisins, wine, etc.
[6] Including value of cider and vinegar.

Of the total value of crops, cotton, including seed, contributed 63.6 per cent; cereals, including Kafir corn and rice, 22.8 per cent; forest products, 3.6 per cent; miscellaneous vegetables, 3.3 per cent; hay and forage, 1.7 per cent; sweet potatoes, 1.7 per cent; and all other products, 3.3 per cent.

The average values per acre of the various crops are as follows: Flowers and plants, $434; nursery products, $173; onions, $103; miscellaneous vegetables, $56; tobacco, $45; potatoes, $39; sweet potatoes, $38; broom corn, $32; cotton, $16; hay and forage, $15; peanuts, $15; orchard fruits, $11; dry beans, $10; and cereals, $8. The crops yielding the highest average returns per acre were grown upon very highly improved land. Their production requires a relatively great amount of labor and large expenditures for fertilizers.

COTTON.

The following table is an exhibit of the changes in cotton production since 1849.

TABLE 19.—ACREAGE AND PRODUCTION OF COTTON: 1849 TO 1899.

YEAR.	ACREAGE.		PRODUCTION.		
	Total.	Per cent of increase.	Commercial bales.	Pounds.	Per cent of increase.
1899	2,897,920	0.5	1,313,798	643,339,470	16.8
1889	2,883,278	36.9	1,154,725	550,803,825	26.2
1879	2,106,215		963,111	436,289,283	77.9
1869			564,938	245,183,092	[1]54.2
1869			1,202,507	535,115,615	176.2
1849			484,292	193,716,800	

[1] Decrease.

In 1859 the amount of cotton produced was nearly three times that of 1849. The Civil War, occurring during the next decade affected all industries, and the quantity of cotton grown decreased 54.2 per cent. From 1869 to 1889 it increased rapidly, and although only a slightly increased acreage was shown for 1899, the production showed a gain of 16.8 per cent for the last decade. Decreases in acreage are noted for many of the counties located in the southern and western parts of the state.

In 1899, 186,999 farmers devoted to cotton an area of 2,897,920 acres, and 38.2 per cent of the improved farm land of the state, an average of 15.5 acres per farm. From this land was produced 643,339,470 pounds of cotton, an average of 222 pounds per acre, 13,883 pounds per square mile of land surface of the state, and 415 pounds per capita. The total value of the product, including the value of the seed, was $54,032,341, an average of $288.94 per farm, and $18.65 per acre. This value constituted 59.5 per cent of the gross farm income.

All the counties in the state are reported as raising cotton, those devoting the greatest number of acres to this product being Yazoo, Washington, Hinds, Bolivar, Noxubee, Holmes, Monroe, and Panola, ranking in the order named and reporting 25.1 per cent of the total acreage.

CEREALS.

Table 20 presents an exhibit of the changes in cereal production since 1849.

TABLE 20.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899.

PART 1.—ACREAGE.

YEAR.[1]	Barley.	Corn.	Oats.	Rice.	Rye.	Wheat.
1899	32	2,276,313	87,066	2,095	103	6,447
1889	80	1,706,352	133,361	1,543	406	2,519
1879	44	1,570,550	198,497	3,501	806	43,524

[1] No statistics of acreage were secured prior to 1879.

TABLE 20.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899—Continued.

PART 2.—BUSHELS PRODUCED.[1]

YEAR.[2]	Barley.	Corn.	Oats.	Rice.	Rye.	Wheat.
1899	330	38,789,920	862,805	739,222	963	37,257
1889	875	26,148,144	1,362,290	676,746	3,544	16,570
1879	348	21,340,800	1,959,620	1,718,951	5,134	218,890
1869	3,973	15,637,316	414,586	374,627	14,852	274,479
1859	1,875	29,057,682	221,235	809,082	39,474	587,925
1849	228	22,446,552	1,503,288	2,719,856	9,606	137,990

[1] Rice reported in pounds.
[2] No statistics of acreage were secured prior to 1879.

The total area devoted to cereals in 1879 was 1,816,922 acres; in 1889, 1,844,261 acres; and in 1899, 2,372,065 acres; an increase for the twenty years of 30.6 per cent. The acreage given for 1899 includes 9 acres devoted to Kafir corn. The increases in the areas devoted to the various cereals in the decade 1889 to 1899 were: Wheat, 155.9 per cent; rice, 35.8 per cent; and corn, 33.4 per cent. The decreases were: Rye, 74.6 per cent; barley, 60.0 per cent; and oats, 34.7 per cent.

Exclusive of rice the total number of bushels reported in 1849 was 24,097,664; and for 1899, 39,691,275; an increase of 64.7 per cent in the half century. The production of rice shows a decrease in the same time of 72.8 per cent.

Of the total area under cereals in 1899, 95.9 per cent was devoted to corn; 3.7 per cent, to oats; and 0.4 per cent, to wheat, rice, rye, barley, and Kafir corn.

Corn, wheat, oats, and rye were reported from nearly all parts of the state. Kafir corn was grown in the 3 counties of Benton, Copiah, and Tippah. Rice was grown in 48 counties, of which the 6 counties of Copiah, Lawrence, Lincoln, Marion, Rankin, and Simpson furnished 60.5 per cent of the entire acreage.

HAY AND FORAGE.

In 1900, 43,012 farmers, or 19.5 per cent of the total number, reported hay or forage crops. Excluding cornstalks and corn strippings, they obtained an average yield of 1.3 tons per acre. The total acreage in hay and forage for 1899 was 99,261, or 50.0 per cent greater than ten years before. Of this acreage 49.2 per cent, or 48,848 acres, produced 65,138 tons of grains cut green for hay.

In 1899 the acreages and yields of the various other kinds of hay and forage were as follows: Wild, salt, and prairie grasses, 6,753 acres and 7,965 tons; millet and Hungarian grasses, 1,397 acres and 2,369 tons; alfalfa or lucerne, 99 acres and 201 tons; clover, 2,940 acres and 3,500 tons; other tame and cultivated grasses, 34,157 acres and 42,638 tons; crops grown for forage, 5,067 acres and 7,521 tons; and cornstalks and corn strippings, 146,709 acres and 35,318 tons.

In Table 18 the production of cornstalks and corn strippings is included under "hay and forage," but the acreage is part of that given for "corn," as the forage secured was only an incidental product of the crop.

SUGAR CANE.

Table 21 presents a comparative exhibit of the acreage of sugar cane, and the production of sugar and sirup: 1849 to 1899.

TABLE 21.—ACREAGE OF SUGAR CANE AND PRODUCTION OF SUGAR AND SIRUP: 1849 TO 1899.

YEAR.[1]	Acreage in cane.	SUGAR.		SIRUP.	
		Production in pounds.	Average yield per acre in pounds.	Production in gallons.	Average yield per acre in gallons.
1899	11,552	18,930	1.6	1,413,219	122.3
1889	12,694	67,860	5.3	1,524,024	120.1
1879	4,555	21,600	4.7	536,625	117.8
1869		58,800		152,164	
1859		607,200		10,016	
1849		465,600			

[1] No statistics of acreage were secured prior to 1879.

The present census shows that in 1899 sugar cane was grown by 26,300 farmers on 11,552 acres, an average of 0.44 acre for each farm reporting. From this area they sold 5,914 tons of cane for $23,918, and from the remaining product manufactured 18,930 pounds of sugar, valued at $893, and 1,413,219 gallons of sirup and molasses valued at $618,975. This was a decrease in acreage since 1889 of 8.9 per cent. The total value of sugar-cane products was $643,786, an average of $24.48 for each farm reporting, and of $55.73 per acre. The value of sugar was 4.7 cents per pound, and of sirup and molasses 43.8 cents per gallon.

In addition to the above it is estimated that 45,809 tons of cane, valued at $161,084, were kept for seed.

SORGHUM CANE.

Sorghum cane was grown in 1899 by 25,183 farmers on 15,734 acres, an average of 0.62 acre for each farm reporting. From this area they sold 3,366 tons of cane for $10,052, and from the remaining product manufactured 1,162,269 gallons of sirup, valued at $313,365. The total value of sorghum-cane products was $323,417, an average of $12.84 for each farm reporting, and of $20.56 per acre.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 may be seen in the following table:

TABLE 22.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900	1890	1899	1889
Apples	705,796	357,309	249,035	605,368
Apricots	5,109	961	772	781
Cherries	30,186	7,579	2,352	3,861
Peaches	1,856,748	878,569	252,305	1,324,354
Pears	177,824	27,107	36,923	18,531
Plums and prunes	689,053	501,392	66,793	107,502

In 1890 the total number of fruit trees was 1,772,917; in 1900 there were 3,499,818, showing an increase for the decade of 1,726,901, or 97.4 per cent. There were more than six times as many pear trees, more than five times as many apricot trees, and nearly four times as many cherry trees reported in 1900 as in 1890. Peach trees increased 111.3 per cent; apple trees, 97.5 per cent; and plum and prune trees, 37.4 per cent, in the last decade.

Of the total number of fruit trees in 1900, 53.0 per cent were peach trees; 20.2 per cent, apple trees; 19.7 per cent, plum and prune trees; 7.1 per cent, pear, cherry, apricot, and unclassified fruit trees. The latter class, which is not included in the table, numbered 35,102 trees and yielded 2,747 bushels of fruit.

The value of orchard fruits, given in Table 18, includes the value of 480 barrels of cider, 388 barrels of vinegar, and 19,290 pounds of dried and evaporated fruits. Comparisons of the yields of orchard fruits, or of their values, are of little importance, as the yield of any given year depends largely upon the nature of the season.

The northern half of the state reports the largest number of the various kinds of fruit trees and shows large increases since 1890. The southern half of the state is better adapted to the cultivation of the tropical fruits. Peach trees, however, are reported from every county, the increase being quite general throughout the state. The six counties which rank above the others in the number of these trees and report 23.3 per cent of the total number, are Madison, Lee, Hinds, Prentiss, Tippah, and Copiah counties.

TROPICAL FRUITS.

The Twelfth Census reports 12,739 fig, 2 lemon, 3,696 orange, and 4 pomelo trees. Two hundred and sixty farms reported fig trees, with a yield of 61,600 pounds, valued at $1,226. For the other tropical fruit trees no products were reported.

SMALL FRUITS.

The total area devoted to small fruits in 1899 was 1,549 acres, distributed among 2,292 farms, an average of 0.7 acre per farm. Of the total area 1,383 acres, or 89.3 per cent, were devoted to strawberries yielding 1,546,570 quarts. The acreages and productions of the other berries were as follows: Blackberries and dewberries, 84 acres and 97,030 quarts; raspberries and Logan berries, 49 acres and 56,020 quarts; currants, 3 acres and 2,830 quarts; gooseberries, 1 acre and 590 quarts; and other small fruits, 29 acres and 32,440 quarts.

VEGETABLES.

The total value of vegetables grown in 1899, including potatoes, sweet potatoes, and onions, was $4,535,977, of which 32.2 per cent represents the value of sweet potatoes; 5.4 per cent, that of potatoes; 0.5 per cent, that of onions; and 61.9 per cent, that of miscellaneous vegetables.

Sweet potatoes were grown in 1899 by 67,490 farmers, or 30.6 per cent of the total number in the state. The area devoted to this crop in 1889 was 44,188 acres, and in 1899, 38,169 acres, a decrease of 13.6 per cent. They were grown most extensively in the southern part of the state.

In the growing of miscellaneous vegetables 50,356 acres were used. Of this area the products of 38,357 acres were not reported in detail. Of the remaining 11,999 acres, 6,253 acres were devoted to watermelons; 2,587 acres, to tomatoes; 1,614 acres, to cabbages; 622 acres, to muskmelons; 244 acres, to cucumbers; 224 acres, to beans; and 455 acres, to other vegetables.

PEANUTS.

Peanuts were grown in 1899 by 8,417 farmers, who devoted to their cultivation 5,853 acres, and secured therefrom a product of 95,738 bushels, an average of 16.4 bushels per acre. Increases of 198.6 per cent in acreage and 132.5 per cent in production are shown for the last decade. All counties of the state reported peanuts; Clarke, Monroe, Marion, and Lauderdale leading. The average acreage per farm was 0.7, and in but few counties exceeded 1 acre.

TOBACCO.

The tobacco crop of Mississippi, like that of many other states, has been subject to great fluctuation. The state produced in 1849, 49,960 pounds of tobacco. The census of 1860 showed a gain over this amount of 109,181 pounds, or 218.5 per cent. The census of 1870 showed a falling off from this of 98,129 pounds, or 61.7 per cent. Between 1870 and 1880 the production increased from 61,012 to 414,663 pounds, a gain of 353,651 pounds, while between 1880 and 1890 there was a decrease of about the same number of pounds, or 85.0 per cent.

The present census shows that in 1899 tobacco was grown in Mississippi by 1,119 farmers, who obtained from 203 acres a yield of 62,760 pounds. This was a gain of 649 pounds, or 1.0 per cent over the crop of 1889, from an area 31 acres less than that of 1889. The total value of the crop was $9,225, or an average of $8.24 for each farm reporting.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 42 acres, and the value of the products sold therefrom was $26,907. These flowers and plants were grown by 53 farmers and florists. Of this number, 11 made commercial floriculture their principal business. They had invested in the aggregate $25,427, of which $7,200 represents the value of the land and improvements other than buildings; $16,650, the value of buildings; $790, that of implements and machinery; and $787, that of live stock. Their sales of flowers and plants amounted to $10,669, and they reported other products valued at $985. They expended for labor $2,985 and for fertilizers $90. The average gross income for each farm reporting was $1,059.

In addition to 10 of the 11 principal florists' establishments, 276 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 61,290 square feet, making, with the 58,890 square feet belonging to the florists' establishments, a total of 120,180 square feet.

NURSERIES.

The total value of nursery stock sold in 1899 was $31,305, reported by the operators of 53 farms and nurseries. Of this number, 14 derived their principal income from the nursery business. They had 1,751 acres of land, valued at $46,560; buildings worth $15,265; implements and machinery, $1,510; and live stock, $3,125. Their total income, inclusive of products fed to live stock, was $28,458, of which $21,978 represents the value of nursery stock, and $6,480 that of other products. The expenditure for labor was $6,800, and for fertilizers, $895. The average income for each farm reporting, including products fed to live stock, was $2,033.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $3,917,256, an average of $18 per farm. The average expenditure was highest on the most intensively cultivated farms, being $486 for nurseries, $271 for florists' establishments, $88 for fruit farms, $35 for hay and grain farms, $30 for live-stock farms, $23 for vegetable farms, $20 for dairy farms, $19 for tobacco farms, $17 for cotton farms, $14 for sugar farms, and $7 for rice farms "Managers" expended on an average, $331; "owners," $27; "cash tenants," $15; and "share tenants," $6. White farmers expended $28 per farm, and colored farmers, $10.

Fertilizers purchased in 1899 cost $932,098, an average of $4 per farm, and an increase since 1890 of 18.1 per cent. The average expenditure was $64 for nurseries, $15 for sugar farms, $13 for vegetable farms, $12 for fruit and rice farms, $8 for florists' establishments, $6 for live-stock and dairy farms, $5 for tobacco farms, $4 for hay and grain farms, and $3 for cotton farms.

IRRIGATION STATISTICS.

Irrigation does not occupy an important place in the agriculture of Mississippi. In 1899, on three farms, 40 acres were irrigated—30 acres in rice and 10 acres in truck and small fruits. The irrigating systems cost $2,825. The most extensive plant is reported from Lauderdale county, and consists of a reservoir capable of irrigating 150 acres, which was made by damming a ravine. A large spring in the hill by the plantation furnishes the supply, which is stored in the reservoir, and thence directed by means of pipes and ditches to the land to be irrigated. This irrigating system complete cost $2,500. On this farm 4 acres in cabbage produced 30,000 heads; 1 acre in asparagus, 2,000 bunches; 1 acre in celery, 2,000 bunches; 2 acres in strawberries, 10,000 quarts; and 1 acre in rice, 4,000 pounds. The value of the irrigated crops on 10 acres was approximately $1,800, or $180 per acre.

The alluvial lands of the state are undoubtedly adapted to the cultivation of rice, but this industry occupies the attention of the agriculturist only to a limited extent. The introduction of modern systems of irrigation would tend greatly to promote the extension of the areas in this crop, and would increase the average yield per acre, which is now only 352 pounds for the state.

()

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 226. WASHINGTON, D. C. JULY 3, 1902.

AGRICULTURE.

TENNESSEE.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

SIR: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the state of Tennessee, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land, under one management, used for raising crops and pasturing live stock, together with the wood lots, swamps, meadows, etc., connected therewith. It includes also the house in which the farmer resides, and all other buildings used by him in connection with his farming operations.

The farms of Tennessee, June 1, 1900, numbered 224,623, and were valued at $265,150,750. Of this amount $63,136,960, or 23.8 per cent, represents the value of buildings, and $202,013,790, or 76.2 per cent, the value of the land and improvements other than buildings. On the same date the value of farm implements and machinery was $15,232,670, and of live stock, $60,818,605. These values, added to that of farms, give $341,202,025, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $106,166,440, of which amount $35,421,198, or 33.4 per cent, represents the value of animal products, and $70,745,242, or 66.6 per cent, the value of crops, including forest products cut or produced on farms. The "total value of farm products" for 1899 is approximately twice that for 1889, but a part of this increase is doubtless due to a more detailed enumeration in 1900 than in 1890.

The "gross farm income" is obtained by deducting the value of the products fed to live stock on the farms of the producers from the total value of farm products. In 1899 the reported value of products fed was $18,430,310, leaving $87,736,130 as the gross farm income for that year. The ratio which this amount bears to the "total value of farm property" is referred to in this bulletin as the "percentage of gross income upon investment." For Tennessee in 1899 it was 25.7 per cent.

As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

The statistics presented in this bulletin will be treated in greater detail in the report on agriculture for the United States. The present publication is designed to present a summarized advance statement for Tennessee.

Very respectfully,

L. G. Powers.

Chief Statistician for Agriculture.

AGRICULTURE IN TENNESSEE.

GENERAL STATISTICS.

The total land area of Tennessee is 41,750 square miles, or 26,720,000 acres, of which 20,342,058 acres, or 76.1 per cent, are included in farms.

Tennessee is divided into three sections—east, middle, and west. East Tennessee extends from the bordering mountains of the Appalachian system to the crest of the Cumberland Plateau, and contains some of the highest ridges of the mountain system, and a valley region of about 100 miles in width, the valley being broken by many minor elevations and depressions.

The middle section is formed by extensions of the Cumberland Plateau at the north and south, reaching as far west as the northern course of the Tennessee River. This extension, known as the Highland Rim, incloses a depression 5,450 square miles in area, resembling the bed of a drained lake and called the Central Basin.

The western division extends from the West Tennessee River to the Mississippi. The eastern part of this section contains ridges and bluffs, and the western is composed of the alluvial bottom lands of the Mississippi, interspersed with numerous lakes and swamps.

The soil in the west is sandy, mellow, and generally fertile, while the black loams of the Mississippi bottom lands are the richest in the state. The greatest diversity of soil is found in east Tennessee, only the valleys and river bottoms having high fertility. The soil of the Cumberland Plateau is sandy, porous, and not very productive, but the rich limestone soils of the Central Basin produce abundantly.

NUMBER AND SIZE OF FARMS.

The following table gives, by decades since 1850, the number of farms, the total and average acreage, and the per cent of farm land improved.

TABLE 1.—FARMS AND FARM ACREAGE: 1850 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	224,623	20,342,058	10,245,950	10,096,108	90.6	50.4
1890	174,412	20,161,583	9,362,555	10,799,028	115.6	46.4
1880	165,650	20,666,915	8,496,556	12,170,359	124.8	41.1
1870	118,141	19,581,214	6,843,278	12,737,936	165.7	34.9
1860	82,368	20,669,165	6,795,337	13,873,828	250.9	32.9
1850	72,735	18,984,022	5,175,173	13,808,849	261.0	27.3

The total number of farms reported in 1900 was over three times as great as in 1850 and 28.8 per cent greater than in 1890. The total acreage has not increased rapidly, the gain since 1850 being but 7.2 per cent, and in the last decade but 0.9 per cent. These changes have resulted in a continuous decrease in the average size of farms, indicating a progressive division of farm holdings and a more complete utilization of the soil. The area of improved land has increased continuously since 1870 and at a more rapid rate than the total farm acreage, the per cent of farm land improved being greater in 1900 than in any previous census year.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1850.

TABLE 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND OF PRODUCTS: 1850 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$341,202,025	$265,150,750	$15,232,670	$60,818,605	$106,166,440
1890	312,891,650	242,700,540	9,936,880	60,254,230	55,194,181
1880	259,456,170	206,749,837	9,054,863	43,651,470	62,076,311
1870[2]	282,027,309	218,743,747	8,199,487	55,084,075	[3]86,472,847
1860	340,036,202	271,358,985	8,465,792	60,211,425	....
1850	133,189,438	97,851,212	5,360,210	29,978,016	....

[1] For year preceding that designated.
[2] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other years they must be diminished one-fifth.
[3] Includes betterments and additions to live stock.

The above table shows the remarkable growth of agriculture in the half century from 1850 to 1900. The increase in the total value of farm property since 1890 was $28,310,375, or 9.0 per cent. The increase in the value of land, improvements, and buildings was $22,450,210, or 9.3 per cent; in that of implements and machinery, $5,295,790, or 53.3 per cent; and in that of live stock, $564,375, or 0.9 per cent. The value of farm products in 1899 was 92.4 per cent greater than the value reported for 1889. A part of this increase, and of that shown for implements and machinery, is doubtless the result of a more detailed enumeration in 1900 than in previous years.

COUNTY STATISTICS.

Table 3 gives an exhibit of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH VALUE OF PRODUCTS OF 1899 NOT FED TO LIVE STOCK, AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Value of products not fed to live stock.	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.

All counties report an increase in the number of farms in the last decade, and nearly two-thirds of the counties report an increase in total farm area. The decrease reported in improved acreage for some of the counties is due to a more intensive cultivation of the soil, and to the use of a more strict definition of the term "improved land" by the Twelfth than by any preceding census. The average size of farms varies in different sections, being 54.8 acres in Shelby county and 182.1 acres in Fentress county. As a rule, the counties reporting large acreage in cotton contain the smallest farms.

Increases in the total value of farms between 1890 and 1900 are reported by over four-fifths of the counties. For the state, the average value of farms in 1900 was $1,180. The increase in the value of implements and machinery was relatively greater and more general than for any other item of farm property. Live stock increased in value in three-fourths of the counties, while the decreases reported for the remaining counties are slight.

FARM TENURE.

Table 4 gives a comparative exhibit of farm tenure in 1880, 1890, and 1900. The farms operated by tenants are divided into two groups designated as farms operated by "cash tenants," who pay a cash rental or a stated amount of labor or farm produce, and farms operated by "share tenants," who pay as rental a share of the products.

In Table 5 the tenure of farms for 1900 is given by race of farmer, the farms operated by owners being subdivided into groups designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it, and the other or others owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive a fixed salary from the owners for their supervision and other services.

Table 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 to 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.
1900	224,623	133,483	28,348	62,792	59.5	12.6	27.9
1890	174,412	120,622	19,762	34,028	69.2	11.3	19.5
1880	165,650	108,454	19,266	37,930	65.5	11.6	22.9

[1] Including "part owners," "owners and tenants," and "managers."

Table 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

Part 1.—NUMBER OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	224,623	114,929	13,652	3,616	1,286	28,348	62,792
White	190,728	107,327	11,962	3,482	1,204	17,439	49,314
Colored	33,895	7,602	1,690	134	82	10,909	13,478
Indian	12	4				1	7
Negro	33,883	7,598	1,690	134	82	10,908	13,471

Part 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	100.0	51.2	6.1	1.6	0.6	12.6	27.9
White	100.0	56.3	6.3	1.8	0.6	9.1	25.9
Colored	100.0	22.4	5.0	0.4	0.2	32.2	39.8

Since 1880 the total number of farms has increased 58,973, or 35.6 per cent. Since 1890 the number of owners has increased 12,861, or 10.7 per cent; that of cash tenants, 8,586, or 43.4 per cent; and that of share tenants, 28,764, or 84.5 per cent. The percentages in Table 4 show that the number of farms operated by share tenants has increased at a greater rate than those operated by owners and cash tenants.

Of the farms of the state, 84.9 per cent are operated by white farmers, and 15.1 per cent by colored farmers. Of the white farmers, 64.4 per cent own all or part of the farms they operate, and 35.6 per cent operate farms owned by others. For colored farmers the corresponding percentages are 27.8 and 72.2. Of the colored farmers, 12 are Indians and the remainder negroes. The Indians own 4 of their farms and rent 7 of them as share tenants.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the number conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

TABLE 6.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	224,623	90.6	20,342,058	100.0	$341,202,025	100.0
White farmers	190,728	98.5	18,791,962	92.4	314,459,889	92.2

Cash tenants	28,348	66.5	1,884,992	9.3	35,747,086	10.5
Share tenants	62,792	56.5	3,549,337	17.4	61,377,039	18.0

[1] Including 12 Indians.

TABLE 7.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY RACE OF FARMER AND BY TENURE.

RACE OF FARMER, AND TENURE.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The state	$899	$281	$68	$271	$391	25.7
White farmers	970	312	73	294	409	24.8
Colored farmers[1]	500	107	38	144	285	36.2
Owners	1,012	367	83	330	438	24.4
Part owners	966	280	76	280	413	25.8
Owners and tenants	1,331	439	109	413	522	22.8
Managers	4,053	1,139	192	780	1,237	20.1
Cash tenants	801	188	51	221	376	29.8
Share tenants	634	139	40	164	281	28.8

[1] Including 12 Indians.

Colored farmers controlled 7.6 per cent of the total acreage and 7.8 per cent of the total value of farm property. The average values of all forms of farm property are less for colored than for white farmers. The high per cent of gross income for colored farmers is a result of the smaller average area of their farms and the more intensive cultivation which is generally given to smaller farms. It is due in some degree, also, to the lower values of the farm property for this group, as the total value of farms, or capital invested, is used as a base in the computation.

Farms operated by managers have the highest average values of all forms of farm property, for many of this class are large cotton plantations, while some are farms connected with state institutions. The ratio which the gross income bears to the total value of farm property is, however, smaller than for any other group. This is due to the high average valuation of these farms and the fact that some of them are not cultivated for profit.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	224,623	90.6	20,342,058	100.0	$341,202,025	100.0
Under 3 acres	1,123	2.2	2,498	(1)	623,399	0.2
3 to 9 acres	9,902	6.4	62,917	0.3	4,546,506	1.3
10 to 19 acres	25,517	14.3	364,695	1.8	12,150,603	3.6
20 to 49 acres	61,442	31.5	1,937,942	9.5	45,173,189	13.2
50 to 99 acres	57,265	68.7	3,935,990	19.4	72,485,325	21.3
100 to 174 acres	42,476	126.5	5,371,931	26.4	85,278,279	25.0
175 to 259 acres	15,108	207.5	3,134,766	15.4	48,416,248	14.2
260 to 499 acres	9,166	336.2	3,081,484	15.2	46,692,634	13.7
500 to 999 acres	2,058	624.6	1,285,379	6.3	15,819,883	4.6
1,000 acres and over	566	2,057.3	1,164,456	5.7	10,015,959	2.9

[1] Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$899	$281	$68	$271	$391	25.7
Under 3 acres	165	277	20	93	166	29.9
3 to 9 acres	197	161	20	81	128	27.9
10 to 19 acres	243	102	29	102	167	35.0
20 to 49 acres	408	137	35	155	259	35.2
50 to 99 acres	722	237	62	245	362	28.6
100 to 174 acres	1,175	376	94	363	492	24.5
175 to 259 acres	1,963	574	139	529	696	21.7
260 to 499 acres	3,281	864	189	760	1,000	19.6
500 to 999 acres	5,089	1,234	263	1,101	1,541	20.0
1,000 acres and over	12,648	2,654	372	2,022	2,853	16.1

The group of farms containing from 20 to 49 acres includes a larger number of farms than any other, but the group "100 to 174" acres constitutes the largest part of the total acreage and value.

With a few exceptions, the average values of all forms of farm property increase with the size of the farms. For the group of farms of less than 3 acres each, the average values are comparatively high, as this group includes 10 of the 32 florists' establishments of the state, besides many market gardens, poultry farms, and city dairies. The income from these industries is determined not so much by the area of land used, as by the capital invested and the amounts expended for labor and fertilizers.

The average gross incomes per acre for the various groups, classified by area, are as follows: Farms under 3 acres, \$74.64; 3 to 9 acres, \$20.16; 10 to 19 acres, \$11.66; 20 to 49 acres, \$8.21; 50 to 99 acres, \$5.27; 100 to 174 acres, \$3.89; 175 to 259 acres, \$3.36; 260 to 499 acres, \$2.97; 500 to 999 acres, \$2.47; and 1,000 acres and over, \$1.39.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading features of the statistics relating to farms classified by principal source of income. If for any farm 40 per cent of the products not fed to live stock consists of hay and grain, the farm is designated a "hay and grain" farm. Should 40 per cent of the total value of products consist of vegetables, the farm is designated a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive their principal income from any one class of farm products. Farms with no income in 1899 are classified according to the agricultural operations upon other farms in the same locality.

TABLE 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	224,623	90.6	20,342,058	100.0	\$341,202,025	100.0
Hay and grain	62,608	97.6	6,107,654	30.0	119,843,688	35.1
Vegetables	2,602	43.9	114,267	0.6	4,694,338	1.4
Fruits	1,396	88.3	123,278	0.6	2,061,448	0.6
Live stock	65,546	100.5	6,585,194	32.4	110,025,387	32.3
Dairy produce	1,850	91.7	169,663	0.8	7,158,200	2.1
Tobacco	6,172	80.5	496,922	2.5	9,539,315	2.8
Cotton	28,007	60.2	1,686,647	8.3	25,895,859	7.6
Sugar	85	53.5	4,646	(1)	80,875	(1)
Flowers and plants	32	10.5	335	(1)	314,935	0.1
Nursery products	57	120.0	6,840	(1)	459,306	0.1
Miscellaneous	56,268	89.7	5,046,712	24.8	61,128,674	17.9

[1] Less than one-tenth of 1 per cent.

TABLE 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900. Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	Per cent of gross income on total investment in farm property.
The State	\$899	\$281	\$68	\$271	\$391	25.7
Hay and grain	1,234	325	82	273	437	22.8
Vegetables	1,133	426	73	172	385	21.4
Fruits	859	340	77	201	568	38.4
Live stock	924	325	75	355	392	23.4
Dairy produce	2,319	854	126	570	717	18.5
Tobacco	896	333	77	240	509	33.0
Cotton	557	142	42	184	369	39.9
Sugar	645	141	36	129	232	24.4
Flowers and plants	6,078	3,369	256	139	5,242	53.3
Nursery products	5,726	1,805	276	251	8,624	107.0
Miscellaneous	605	215	53	213	309	28.4

For the several classes of farms the average values per acre of products not fed to live stock are: For farms deriving their principal income from flowers and plants, \$500.75; nursery products, \$71.87; vegetables, \$8.77; dairy produce, \$7.81; fruits, \$6.43; tobacco, \$6.33; cotton, \$6.13; hay and grain, \$4.48; sugar, \$4.34; live stock, \$3.91; and miscellaneous, \$3.44.

The wide variations shown in the averages and percentages of gross income are due largely to the fact that in computing gross income no deduction is made for expenditures. For florists' establishments, nurseries, and market gardens, the average expenditure for such items as labor and fertilizers represents a far larger percentage of the gross income than in the case of "hay and grain," "live-stock," or "miscellaneous" farms. Were it possible to present the average net incomes, the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.

$250 to $499	709	236	61	256	348	27.6
$500 to $999	1,504	474	123	438	667	26.3
$1,000 to $2,499	3,752	1,040	241	851	1,402	23.8
$2,500 and over	10,520	2,771	495	2,168	4,451	28.0

There were 1,124 farms reporting no income in 1899. Some of these farms are summer or suburban homes, some are farms partially abandoned in 1899, while others had changed owners or tenants, and the persons in charge June 1, 1900, were unable to give definite information concerning the products of the preceding year. To this extent the reports fall short of giving a complete statement of farm income in 1899.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the Twelfth Census. The age grouping for neat cattle was determined in accordance with their present and prospective relations to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits a very close comparison with previous census reports.

Table 14 presents a summary of live-stock statistics.

TABLE 14.—NUMBER OF DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age in years.	ON FARMS.			NOT ON FARMS.
		Number.	Value.	Average value.	Number.
Calves	Under 1	236,000	$1,606,949	$6.81	12,246
Steers	1 and under 2	110,368	1,432,689	12.98	2,183
Steers	2 and under 3	68,301	1,236,363	18.10	1,168
Steers	3 and over	20,127	490,640	24.38	1,034
Bulls	1 and over	11,927	292,251	24.50	222
Heifers	1 and under 2	94,224	1,243,158	13.19	2,106

Value of all live stock	....	....	60,818,605	....	....

TABLE 14.—NUMBER OF DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS—Continued.

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.

[2] Including Guinea fowls.

The value of all live stock on farms, June 1, 1900, was $60,818,605. Of this amount, 32.4 per cent represents the value of horses; 26.6 per cent, that of mules; 13.4 per cent, that of dairy cows; 12.0 per cent, that of other neat cattle; 8.0 per cent, that of swine; 3.7 per cent, that of poultry; 1.9 per cent, that of sheep; and 2.0 per cent, that of all other live stock.

No reports were secured of the value of live stock not on farms, but it is probable that such animals had higher average values than those on farms. Allowing the same averages, however, the value of all domestic animals not on farms was $4,245,914, and the total value of live stock in the state, exclusive of poultry and bees not on farms, was approximately $65,064,519.

CHANGES IN LIVE STOCK ON FARMS.

The following table shows the changes since 1850 in the numbers of the most important domestic animals.

TABLE 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS: 1850 TO 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	321,676	590,507	352,388	262,609	307,804	1,976,984
1890	345,311	620,028	311,842	203,639	540,996	1,922,912
1880	303,900	479,774	266,119	173,498	672,789	2,160,495
1870	243,197	400,499	247,254	102,983	826,783	1,828,690
1860	249,514	515,218	290,882	126,345	773,317	2,347,321
1850	250,456	500,306	270,636	75,303	811,591	3,104,800

[1] Lambs not included.

With the exception of sheep and swine, larger numbers of all classes of live stock are reported for 1900 than for 1850. Every class shows fluctuations from decade to decade, but a general increase in the number of horses and mules has been reported, while the raising of meat-producing stock for market has declined in importance.

For the decade following 1890 the following increases in numbers are shown: Mules and asses, 28.9 per cent; horses, 13.0 per cent; and swine, 2.8 per cent; with the following decreases: Sheep, 43.1 per cent; dairy cows, 6.8 per cent; and other neat cattle, 4.8 per cent.

The apparent decrease in numbers of dairy cows is probably due to the term "cows and heifers kept for milk" being restricted in 1900 to those milked at the time of enumeration, while many cows milked at some time in the year, but dry at the time of enumeration, were classed with "cows and heifers not kept for milk," and consequently with "other neat cattle." The increased production of milk in 1899 tends to confirm this statement.

The enumerators in 1900 were instructed to report no fowls under three months old, which limitation was not made in former census reports. This fact probably accounts for the following decreases in numbers of all classes of domestic fowls in the decade 1890 to 1900: Turkeys, 55.1 per cent; geese, 49.7 per cent; chickens, 48.7 per cent; and ducks, 44.1 per cent.

ANIMAL PRODUCTS.

Table 16 is a summarized statement of the animal products of 1899.

TABLE 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	1,395,295	$263,351
Mohair and goat hair	Pounds	1,486	428
Milk	Gallons	[1]147,336,961	[2]8,028,466
Butter	Pounds	29,091,696	
Cheese	Pounds	26,622	
Eggs	Dozens	31,807,990	3,115,335
Poultry			4,282,740
Honey	Pounds	2,404,550	259,691
Wax	Pounds	79,590	
Animals sold			11,121,141
Animals slaughtered			8,350,046
Total value			35,421,198

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of all milk sold or consumed and of butter and cheese made.

The value of the animal products for 1899 was $35,421,198. Of this amount, 55.0 per cent represents the value of animals sold and animals slaughtered on farms, 22.7 per cent, that of dairy produce, 20.9 per cent, that of poultry and eggs, 0.7 per cent, that of wool, mohair, and goat hair, and 0.7 per cent, that of honey and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

The value of animals sold and animals slaughtered on farms in 1899 was $19,471,187, or 18.3 per cent of the value of all farm products. Of all farmers in the state, 182,375, or 81.2 per cent, report animals slaughtered, the average value per farm being $45.79. Animals sold were reported by 122,331 farmers, or 54.5 per cent of the total number, the average amount received per farm being $90.91. In obtaining these reports, the enumerators were instructed to secure from each farm operator a statement of the amount received from sales in 1899, less the amount paid for animals purchased during the same year.

DAIRY PRODUCE.

The production of milk in 1899 was 39,679,845 gallons greater than in 1889, a gain of 36.9 per cent. Butter made on farms increased in amount 2.7 per cent, and the production of cheese decreased 61.9 per cent in the same time.

Of the $8,028,466 given in Table 16 as the value of dairy produce, $6,518,283, or 81.2 per cent, represents the value of such products consumed on farms, and $1,510,183, or 18.8 per cent, the amount received from sales. Of the latter amount, $819,203 was received from the sale of 5,192,022 pounds of butter; $676,996, from 5,549,194 gallons of milk; $12,341, from 22,566 gallons of cream; and $1,643, from 15,673 pounds of cheese.

POULTRY AND EGGS.

Of the $7,398,075 given as the value of poultry products in 1899, 57.9 per cent represents the value of poultry raised, and 42.1 per cent that of eggs produced. There were 8,635,677 dozen more eggs reported in 1899 than in 1889, a gain of 37.3 per cent. This increase in production of eggs tends to confirm the statement made elsewhere that the apparent decrease in number of chickens is due to a difference in methods of enumeration.

WOOL.

The production of wool for the state was greatest in 1879, followed by a great decrease in the following decade and a decrease of 2,371 pounds, or less than 0.2 per cent, since 1889. The decrease in the last decade was probably more marked than the small percentage indicates, owing to the fact that in 1890 the fleeces from at least 95,343 sheep were omitted from the tables, but included in a general estimate of the wool shorn after the census enumeration. Wool was reported from about one-sixth of all farms reporting live stock in 1899.

HONEY AND WAX.

The production of honey in 1899 was 2,404,550 pounds, and of wax 79,590 pounds, which, compared with 2,284,155 pounds of honey and 63,290 pounds of wax in 1889, shows an increase in ten years of 5.3 per cent in honey and 25.8 per cent in wax.

HORSES, MULES, AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses, mules, and dairy cows, and the average number of these animals per farm. In computing the averages presented, only those farms which report the kind of stock under consideration are included.

TABLE 17.—HORSES, MULES, AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.		MULES.		DAIRY COWS.	
	Farms reporting.	Average per farm.	Farms reporting.	Average per farm.	Farms reporting.	Average per farm.
Total	158,355	2.2	112,385	2.3	179,025	1.8
White farmers	138,689	2.3	96,945	2.4	159,681	1.8
Colored farmers	19,666	1.7	15,440	1.6	19,344	1.5
Owners[1]	102,248	2.4	71,751	2.5	115,784	1.9
Managers	977	3.9	803	5.0	1,006	6.4
Cash tenants	19,850	1.9	14,696	1.9	20,230	1.7
Share tenants	35,280	1.8	25,135	1.8	42,005	1.4
Under 20 acres	17,660	1.4	8,715	1.4	20,630	1.3
20 to 99 acres	82,520	1.9	55,623	1.7	94,226	1.5
100 to 174 acres	34,876	2.6	27,605	2.4	38,923	2.0
175 to 259 acres	12,968	3.1	11,085	3.1	14,185	2.4
260 acres and over	10,331	4.1	9,357	4.8	11,061	3.7
Hay and grain	42,427	2.3	30,303	2.4	46,077	1.8
Vegetables	1,689	1.9	957	1.9	1,431	1.6
Fruits	952	1.9	536	1.8	998	1.7
Live stock	52,388	2.5	34,992	2.4	58,156	1.8
Dairy	1,518	4.2	772	2.7	1,850	7.0
Tobacco	3,895	2.0	4,162	2.2	4,573	1.4
Cotton	17,436	1.8	14,550	1.8	18,115	1.6
Miscellaneous[2]	38,050	1.9	26,113	2.2	47,825	1.7

[1] Including "part owners" and "owners and tenants."
[2] Including sugar farms, florists' establishments, and nurseries.

In Tennessee, as in other states where cotton is a staple crop and much of the farm labor is performed by negroes, large numbers of mules are used as work animals. For most classes of farms, the average numbers of mules and horses are about equal, but on farms operated by managers, and on farms of the largest area, more mules than horses are reported. This is due to the fact that these two classes include a relatively large number of cotton plantations.

If the number of horses and mules be combined, the average number of work animals per farm compares favorably with the corresponding figures for the more intensively cultivated farms of New England.

CROPS.

The following table gives the statistics of the principal crops grown in 1899.

TABLE 18.—ACREAGES, QUANTITIES, AND VALUES OF THE PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantity.	Value.
Corn	3,374,574	Bushels	67,307,390	$28,059,508
Wheat	1,426,112	Bushels	11,924,010	7,882,697
Oats	235,313	Bushels	2,725,330	887,940
Barley	1,590	Bushels	21,636	11,273
Rye	16,556	Bushels	107,912	68,381
Buckwheat	1,173	Bushels	8,597	4,690
Broom corn	3,444	Pounds	1,015,460	47,252
Kafir corn	10	Bushels	257	103
Flaxseed	1	Bushels	7	7
Clover seed		Bushels	7,414	34,145
Grass seed		Bushels	76,952	70,332
Hay and forage	645,617	Tons	802,720	6,811,577
Cotton seed		Tons	[1]95,333	974,046
Cotton	623,137	Bales	234,592	8,192,642
Tobacco	71,849	Pounds	49,157,550	2,748,495
Hops	(2)	Pounds	307	32
Peanuts	19,534	Bushels	747,668	392,648
Peppermint	2	Pounds	170	4
Dry beans	5,563	Bushels	48,736	57,660
Dry pease	82,841	Bushels	760,663	767,840
Potatoes	27,103	Bushels	1,404,097	817,419
Sweet potatoes	23,374	Bushels	1,571,575	883,620
Onions	1,124	Bushels	147,679	106,421
Miscellaneous vegetables	74,284			3,339,132
Maple sugar		Pounds	1,160	167
Maple sirup		Gallons	171	169
Sorghum cane	31,364	Tons	[3]21,886	61,793
Sorghum sirup		Gallons	2,047,655	585,336
Small fruits	12,944			593,092
Grapes	[4]1,413	Centals	43,551	[5]120,199
Orchard fruits	[4]208,625			[6]1,479,915
Tropical fruits				112
Nuts				5,828
Forest products				5,086,624
Flowers and plants	140			175,979
Seeds	8			458
Nursery products	2,838			474,133
Miscellaneous	17			3,573
Total	6,890,550			70,745,242

[1] Exclusive of 22,561 tons, valued at $230,571, sold in seed cotton and included with the cotton.
[2] Less than 1 acre.
[3] Sold as cane.
[4] Estimated from number of vines or trees.
[5] Including value of raisins, wine, etc.
[6] Including value of cider, vinegar, etc.

Of the total value of crops, cereals, including Kafir corn, contributed 52.2 per cent; cotton and cottonseed, 13.0 per cent; hay and forage, 9.6 per cent; forest products, 7.2 per cent; miscellaneous vegetables, 4.7 per cent; tobacco, 3.9 per cent; orchard fruits, 2.1 per cent; potatoes, 1.2 per cent; sweet potatoes, 1.2 per cent; dry pease, 1.1 per cent; sorghum cane and sorghum sirup, 9.0 per cent; and all other products, 2.9 per cent.

The average values per acre of the various crops are as follows: Flowers and plants, $1,257; nursery products, $167; onions, $95; grapes, $85; miscellaneous vegetables, $45; tobacco, $38; sweet potatoes, $38; potatoes, $30; sorghum cane and sorghum sirup, $21; peanuts, $20; cotton and cotton seed, $15; broom corn, $14; hay and forage, $11; dry beans, $10; dry pease, $9; cereals, including Kafir corn, $7; and orchard fruits, $7.

The crops yielding the highest average returns per acre were grown upon very highly improved land. Their production requires a relatively great amount of labor and large expenditures for fertilizers.

CEREALS.

The following table shows the changes in cereal production since 1849.

TABLE 19.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899.

PART 1.—ACREAGE.

YEAR.[1]	Barley.	Buck-wheat.	Corn.	Oats.	Rye.	Wheat.
1899	1,590	1,173	3,374,574	235,313	16,556	1,426,112
1889	3,585	1,231	2,791,324	588,138	26,443	877,361
1879	2,600	4,907	2,904,873	468,566	32,498	1,196,563

PART 2.—BUSHELS PRODUCED.

YEAR.	Barley.	Buck-wheat.	Corn.	Oats.	Rye.	Wheat.
1899	21,636	8,597	67,307,390	2,725,330	107,912	11,924,010
1889	63,866	7,143	63,635,350	7,355,100	165,621	8,300,789
1879	30,019	33,434	62,764,429	4,722,190	156,419	7,331,353
1869	75,068	77,437	41,343,614	4,513,315	223,335	6,188,916
1859	25,144	14,481	52,089,926	2,267,814	257,989	5,459,268
1849	2,737	19,427	52,276,223	7,703,086	89,137	1,619,386

[1] No statistics of acreage were secured prior to 1879.

The total area devoted to cereals in 1879 was 4,610,002 acres; in 1889, 4,288,082 acres; and in 1899, 5,055,318 acres, an increase in twenty years of 9.7 per cent. The increases in area under cereals in the decade from 1889 to 1899 were: Wheat, 62.5 per cent, and corn, 20.9 per cent. The decreases were: Oats, 60.0 per cent; barley, 55.6 per cent; rye, 37.4 per cent; and buckwheat, 4.7 per cent. The total number of bushels produced in 1849 was 61,709,996, and in 1899, 82,094,875 bushels, an increase of 33.0 per cent in fifty years.

Of the total area devoted to cereals in 1899, 66.7 per cent was devoted to corn; 28.2 per cent, to wheat; 4.7 per cent, to oats; and 0.4 per cent, to rye, barley, and buckwheat.

Corn, wheat, and oats are reported from all the counties. Barley is reported from 53 counties of the 96, Davidson, Maury, Williamson, and Washington reporting 62.3 per cent of the total area. Rye is cultivated in 92 counties, Bedford, Lincoln, Moore, and Giles counties, in the south, reporting over one-third of the total acreage. Johnson and Carter, on the northeastern border, report approximately one-half of the entire area in buckwheat.

HAY AND FORAGE.

In 1900, 118,357 farmers, or 52.7 per cent of the total number, reported hay or forage crops. Excluding cornstalks and corn strippings, they obtained an average yield of 1.05 tons per acre. The total area in hay and forage for 1899 was 645,617 acres, or 13.0 per cent greater than ten years before.

The acreages and yields of the various kinds of hay and forage in 1899 were as follows: Wild, salt, and prairie grasses, 11,528 acres and 10,444 tons; millet and Hungarian grasses, 97,576 acres and 104,690 tons; alfalfa, or lucern, 654 acres and 1,173 tons; clover, 104,134 acres and 106,829 tons; other tame and cultivated grasses, 218,821 acres and 222,795 tons; grains cut green for hay, 181,318 acres and 184,946 tons; crops grown for forage, 31,586 acres and 48,573 tons; and cornstalks and corn strippings, 303,057 acres and 123,270 tons.

In Table 18 the production of cornstalks and corn strippings is included under "hay and forage," but the acreage is included under "corn," as the forage secured was an incidental product of the corn crop.

COTTON.

The following table is a statement of the changes in cotton production since 1849.

TABLE 20.—ACREAGE AND PRODUCTION OF COTTON: 1849 TO 1899.

YEAR.	ACREAGE.		PRODUCTION.		
	Total.	Per cent of increase.	Commercial bales.	Pounds.	Per cent of increase.
1899	623,137	[1]16.6	234,592	117,504,070	29.3
1889	747,471	3.4	190,579	90,906,183	[1]39.3
1879	722,562	....	330,621	149,771,313	89.8
1869	....	....	....	78,919,428	[1]40.2
1859	....	....	....	131,926,480	69.5
1849	....	....	....	77,812,800	....

[1] Decrease.

In 1899, 53,405 farmers seeded an area of 623,137 acres to cotton, an average of 11.7 acres per farm, or 6.1 per cent of the total improved land. From this land was produced 117,504,070 pounds of cotton, an average of 2,200 pounds per farm, 189 pounds per acre, and 58 pounds per capita. The total value of this crop, including the value of the cottonseed, was $9,166,688, an average of $171.64 per farm, and $14.72 per acre. This value constituted 10.4 per cent of the gross farm income.

The counties devoting the greatest number of acres to cotton were Shelby, Fayette, Tipton, Haywood, Hardeman, Madison, and Lauderdale, ranking in the order named, and reporting 64.8 per cent of the total acreage.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 may be seen in the following table.

TABLE 21.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900	1890	1899	1889
Apples	7,714,053	5,020,400	5,387,775	7,283,945
Apricots	4,528	2,977	211	423
Cherries	217,917	68,715	11,688	19,636
Peaches	2,749,203	2,347,699	77,678	2,555,099
Pears	263,585	96,729	43,609	49,923
Plums and prunes	712,256	454,421	73,315	105,359

The total number of trees in 1890 was 7,990,941, and in 1900, 11,708,629, an increase in the decade of 3,717,688 trees, or 46.5 per cent. Increases are shown for the decade as follows: Cherries, 217.1 per cent; pears, 172.4 per cent; plums and prunes, 56.7 per cent; apples, 53.7 per cent; apricots, 52.1 per cent; and peaches, 17.1 per cent.

Of the total number of trees in 1900, 65.9 per cent were apple trees; 23.5 per cent, peach trees; 6.1 per cent, plum and prune trees; and 4.5 per cent, cherry, pear, apricot, and unclassified fruit trees—the latter class, which is not included in the table, numbering 47,087, and yielding 5,412 bushels of fruit.

The value of the orchard products given in Table 18 includes the value of 9,372 barrels of vinegar, and 2,538,810 pounds of dried and evaporated fruits manufactured on farms. Comparisons of yields or their values, when made by decades only, have little significance, owing to seasonal variations.

Knox county in the eastern part of the state, Warren county in the central, and Wilson in the northern, report the largest numbers of apple trees, showing 10.7 per cent of the total number. The largest number of peach trees is reported from Knox and Hamilton counties, and the five counties of Williamson, Knox, Davidson, Maury, and Wilson, ranking in the order named, report 27.8 per cent of the total number of pear trees. McNairy, Henderson, and Jackson counties report 18.1 per cent of the total number of plum and prune trees. Apricots received little attention.

SMALL FRUITS.

The total area devoted to the cultivation of small fruits in 1899 was 12,944 acres, distributed among 17,416 farms. Of the total area, 11,548 acres, or 89.2 per cent, were devoted to strawberries, yielding 13,683,840 quarts. They were raised chiefly in Gibson, Hamilton, Weakly, Rhea, and Crockett counties, which reported 74.0 per cent of the acreage and 68.1 per cent of the production. The acreage and production of the other berries were as follows: Blackberries and dewberries, 733 acres and 839,210 quarts; raspberries and Logan berries, 471 acres and 448,170 quarts; gooseberries, 114 acres and 150,620 quarts; currants, 12 acres and 13,190 quarts; and other small fruits, 66 acres and 65,090 quarts.

VEGETABLES.

The total area used in the cultivation of vegetables, including potatoes, sweet potatoes, and onions, in 1899, was 125,885 acres. Of the total acreage 59.0 per cent was devoted to miscellaneous vegetables, 21.5 per cent to potatoes, 18.6 per cent to sweet potatoes, and 9.0 per cent to onions. Aside from the land devoted to potatoes, sweet potatoes, and onions, 74,284 acres were used in the growing of miscellaneous vegetables. Of this area, 54,387 acres were included in family gardens or farms, the vegetable products of which were not reported in detail. Of the 19,897 acres concerning which detailed reports were received, 9,064 were devoted to watermelons; 4,341, to cabbages; 2,536, to tomatoes; 1,587, to muskmelons; 719, to sweet corn; 562, to beans; 496, to cucumbers; and 592, to other vegetables.

PEANUTS.

Peanuts were grown in 1899 by 4,546 farmers, who devoted to their cultivation 19,534 acres and received therefrom a product of 747,668 bushels. Increases of 20.3 per cent in acreage and 42.9 per cent in production are shown for the last decade. The average yield per acre was 32.2 bushels in 1889 and 38.3 bushels in 1899.

The counties of Perry, Humphreys, Benton, Decatur, Hickman, and Wayne, lying in the Tennessee River Valley and ranking in the order named, report 98.5 per cent of the total acreage in this crop.

TOBACCO.

According to the census of 1850 Tennessee produced in 1849, 20,148,932 pounds of tobacco, while that of 1860 showed a gain of 23,299,165 pounds, or 115.6 per cent. The reports of 1870 showed a decline of 21,982,645 pounds, or 50.6 per cent. Between 1870 and 1880 there was a gain of 36.8 per cent, and between 1880 and 1890, a gain of 23.8 per cent.

The present census shows that in 1899 tobacco was grown in Tennessee by 27,960 farmers, who obtained from 71,849 acres a yield of 49,157,550 pounds, valued at $2,748,495. This was an increase in area since 1889 of 20,378 acres, or 39.6 per cent, and, in production, of 12,789,155 pounds, or 35.2 per cent. The average yield per acre in 1899 was 684 pounds, against 707 pounds in 1889, and 707 pounds in 1879. The average value was 5.6 cents per pound. The average area in tobacco for each farm on which it was grown was 2.6 acres.

The tobacco crop of 1899 was distributed over every county of the state. The leading county was Montgomery, with 17,593 acres; the next in rank being Robertson and Weakly counties, with 13,488 acres and 12,858 acres, respectively. These three counties together contributed 61.2 per cent of the entire acreage, and 64.2 per cent of the entire production.

SORGHUM CANE.

The present census shows that in 1899 sorghum cane was grown by 45,461 farmers, on 31,364 acres, an average of 0.69 acre for each farm reporting. From this area they sold 21,886 tons of cane for $61,793, and from the remaining product manufactured 2,047,655 gallons of sirup, valued at $585,336. This was a decrease in acreage since 1889 of 22.2 per cent.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1889 was 140 acres, and the value of the products sold therefrom was $175,979. These flowers and plants were grown by 93 farmers and florists. Of this number 32 made commercial floriculture their principal business. These 32 proprietors reported a glass surface of 525,780 square feet. The capital invested in land, buildings, implements, and live stock was $314,935, of which $107,800 represents the value of buildings. Their sales of flowers and plants amounted to $157,008, and the value of their other products was $10,742. They expended $28,920 for labor and $3,150 for fertilizers. The average value for each farm reporting, including products fed to live stock, was $5,288.

In addition to the 32 principal florists' establishments, 445 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 504,295 square feet, making, with the 394,335 square feet belonging to the florists' establishments, a total of 898,630 square feet.

NURSERIES.

The total value of nursery stock sold in 1899 was $474,133, reported by the operators of 159 farms and nurseries. Of this number 57 derived their principal income from the nursery business. They had 6,840 acres of land, valued at $326,385; buildings worth $102,880; implements and machinery worth $15,730; and live stock worth $14,311. Their total income, exclusive of products fed to live stock, was $491,566, of which $451,213 represents the value of nursery stock, and $40,353 that of other products. The expenditure for labor was $72,380, and for fertilizers, $3,165. The average income from each farm reporting, including products fed to live stock, was $8,767.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $4,730,370, an average of $21 per farm. The average expenditure was $1,270 for nurseries, $904 for florists' establishments, $81 for dairy farms, $64 for fruit farms, $47 for vegetable farms, $35 for tobacco farms, $25 for hay and grain farms, $21 for live-stock farms, $16 for cotton farms, and $4 for sugar farms. "Managers" expended on an average $160; "owners," $26; "cash tenants," $17; and "share tenants," $9. White farmers expended $24 per farm, and colored farmers, $7.

Fertilizers purchased in 1899 cost $898,070, an average of $4 per farm and an increase since 1890 of 148.7 per cent. The average expenditure was $98 for florists' establishments, $56 for nurseries, $13 for tobacco farms, $8 for vegetable farms, $6 for hay and grain farms, $5 for dairy farms, $3 for fruit and live-stock farms, and $1 for cotton farms.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 227. WASHINGTON, D. C. July 3, 1902.

AGRICULTURE.

LOUISIANA.

Hon. WILLIAM R. MERRIAM,

Director of the Census.

SIR: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture in the state of Louisiana, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

> The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land, under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It includes also the house in which the farmer resides, and all other buildings used by him in connection with his farming operations.

The farms of Louisiana, June 1, 1900, numbered 115,969, and were valued at $141,130,610, of which amount $33,400,400, or 23.7 per cent, represents the value of buildings, and $107,730,210, or 76.3 per cent, the value of the land and improvements other than buildings. On the same date the value of farm implements and machinery was $28,536,790, and of live stock $28,869,506. These values, added to that of farms, give $198,536,906, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of all such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $72,667,302, of which amount $10,012,759, or 13.8 per cent, represents the value of animal products, and $62,654,543, or 86.2 per cent, the value of crops, including forest products cut or produced on farms. The total value of farm products for 1899 exceeds that for 1889 by $18,323,349, or 33.7 per cent.

The "gross farm income" is obtained by deducting from the total value of farm products the value of the products fed to live stock on the farms of the producers. In 1899 the reported value of products fed was $6,528,470, leaving $66,138,832 as the gross farm income. The ratio which this latter amount bears to the "total value of farm property" is referred to in the text as the "percentage of gross income upon investment." For Louisiana in 1899 it was 33.3 per cent.

As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

The statistics presented in this bulletin will be treated in greater detail in the final report on agriculture in the United States. The present publication is designed to present a summarized advance statement for Louisiana.

Very respectfully,

L. G. Powers.

Chief Statistician for Agriculture.

AGRICULTURE IN LOUISIANA

GENERAL STATISTICS.

Louisiana has a total land area of 45,420 square miles, or 29,068,800 acres, of which 11,059,127 acres, or 38.0 per cent, are included in farms.

The greater part of the surface of Louisiana is low and level. South of New Orleans, and for 120 miles north of that place, the land along the Mississippi is below the surface of the river at high tide, being protected by levees from inundation. The northern and western portions of the state are diversified by low hills, consisting of pine barrens.

From an agricultural standpoint there is very little waste land in the state. With its rich, alluvial delta, its fertile uplands, and its heavy and well-distributed rainfall, Louisiana presents conditions highly favorable to varied agriculture and horticulture. The only lands whose cultivation is not practicable, except at a great cost, are portions of the coast marsh lands, which, however, afford fine pasturage. The river bottoms are exceedingly productive, and the alluvial lands, which vary from 10 to 40 feet in depth, are easily drained and of an inexhaustible fertility. The uplands are rich, but the prairies are better suited for grazing than for agriculture.

NUMBER AND SIZE OF FARMS.

The following table gives, by decades since 1850, the number of farms, the total and average acreage, and the per cent of farm land improved.

TABLE 1.—FARMS AND FARM ACREAGE: 1850 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	115,969	11,059,127	4,666,532	6,392,595	95.4	42.2
1890	69,294	9,544,219	3,774,668	5,769,551	137.7	39.5
1880	48,292	8,273,506	2,739,972	5,533,534	171.3	33.1
1870	28,481	7,025,817	2,045,640	4,980,177	246.7	29.1
1860	17,328	9,298,576	2,707,108	6,591,468	536.6	29.1
1850	13,422	4,989,043	1,590,025	3,399,018	371.7	31.9

The number of farms increased rapidly throughout the half century, the rate of gain for the last decade being 67.4 per cent. During the decade 1850 to 1860 the total farm area almost doubled. The effect of the Civil War is plainly shown in the report of 1870, which shows a decreased farm acreage from which the state did not recover until 1890. Since 1860 the average size of farms has steadily decreased. The per cent of farm land improved shows an increase for each decade since 1870. These changes indicate a more intensive cultivation and a more complete utilization of the soil.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1850.

TABLE 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY AND OF FARM PRODUCTS: 1850 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$198,536,906	$141,130,610	$28,536,790	$28,869,506	$72,667,302
1890	110,447,005	85,381,270	7,167,355	17,898,380	54,343,953
1880	76,770,547	58,989,117	5,435,525	12,345,905	42,883,522
1870[2]	91,303,942	68,215,421	7,159,333	15,929,188	[3]52,006,622
1860	247,984,827	204,789,662	18,648,225	24,546,940	....
1850	98,543,611	75,814,398	11,576,938	11,152,275	....

[1] For year preceding that designated.
[2] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other years they must be diminished one-fifth.
[3] Includes betterments and additions to live stock.

The remarkable growth of agriculture in the decade from 1850 to 1860, the disastrous effects of the Civil War, and the subsequent partial recovery of the state, are the most interesting features of the above table. While the total value of farm property is still below that of 1860, the loss is wholly in the value of land, improvements, and buildings, as the values of implements and machinery and of live stock show decided gains.

In the last ten years the total value of farm property has increased $88,089,901, or 79.8 per cent. In the same time the value of land, improvements, and buildings increased $55,749,340, or 65.3 per cent; that of live stock, $10,971,126, or 61.3 per cent, and nearly four times as great values for implements and machinery were reported in 1900 as in 1890. The value of farm products for 1899 exceeds that for 1889 by $18,323,349, or 33.7 per cent. Part of the increase in the value of implements and machinery is doubtless due to a more detailed enumeration in 1900 than in previous census years.

PARISH STATISTICS.

Table 3 gives a statement of general agricultural statistics by parishes.

TABLE 3.—NUMBER AND ACREAGE OF FARMS AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH VALUE OF PRODUCTS OF 1899 NOT FED TO LIVE STOCK, AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY PARISHES.

PARISHES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Value of products not fed to live stock.	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.
The State	115,969	110,796	11,059,127	4,666,532	$107,730,210	$33,400,400	$28,536,790	$28,869,506	$66,138,832	$10,692,710	$1,076,890
Acadia	2,481	2,373	276,490	143,354	3,413,830	599,540	354,150	906,171	1,983,760	237,080	2,860
Ascension	1,200	1,157	115,914	61,519	2,514,980	981,270	1,550,330	585,697	1,061,033	251,640	73,610
Assumption	456	422	111,180	64,331	4,105,940	1,347,360	2,314,960	513,913	1,610,913	619,580	86,630
Avoyelles	4,674	4,502	194,841	117,171	3,836,780	941,830	342,300	838,812	2,097,357	104,350	5,610
Bienville	2,392	2,261	300,563	109,729	815,150	328,070	92,000	421,660	717,248	35,600	7,870
Bossier	3,212	3,058	278,524	128,423	2,671,490	579,210	145,160	553,824	1,534,390	93,720	2,940
Caddo	4,648	4,246	348,957	179,649	3,789,560	1,051,180	178,560	875,953	1,975,827	129,720	4,180

An increase since 1890 in the number of farms is reported for all parishes except Assumption and St. James. About one-third of the parishes report decreases in farm area, all of these except Red River parish being in the eastern part of the state. The decreased improved acreage reported for some of the parishes is due to a more intensive cultivation of smaller areas of farm land, and to the use of a more strict definition of the term "improved" by the Twelfth than by any preceding census. The average size of farms for the state is 95.4 acres, ranging from 19.4 acres in Orleans parish to 354.1 acres in Cameron parish. The larger farms are, as a rule, in the parishes containing a number of rice and sugar plantations, and the smaller farms in the cotton-growing parishes.

For the state, the average value of farms (including land, improvements, and buildings) is $1,217. Nine-tenths of the parishes report increased total values of farms in the last decade. Only four parishes—Concordia, Red River, St. Bernard, and Tensas—report decreases in the value of implements and machinery. The same number of parishes report smaller values of live stock.

FARM TENURE.

Table 4 is an exhibit of farm tenure for 1900, showing the number and per cent of farms operated by owners and by tenants. Tenants are divided into two groups: "Cash tenants," who pay a rental in cash or in a stated amount of labor or farm produce, and "share tenants," who pay as rental a stated share of the products.

In Table 5 the tenure of farms in 1900 is given by race of farmer, and "farms operated by owners" are subdivided into groups designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it and the other, or others, owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive for their supervision and other services a fixed salary from the owners.

TABLE 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 TO 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.
1900	115,969	48,735	28,922	38,312	42.0	25.0	33.0
1890	69,294	38,539	11,745	19,010	55.6	17.0	27.4
1880	48,292	31,286	6,669	10,337	64.8	13.8	21.4

[1] Including "part owners." "owners and tenants," and "managers."

TABLE 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

PART 1.—NUMBER OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	115,969	44,715	2,634	352	1,034	28,922	38,312
White	57,809	36,255	1,759	309	955	7,721	10,810
Colored[1]	58,160	8,460	875	43	79	21,201	27,502

PART 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	100.0	38.6	2.3	0.3	0.9	24.9	33.0
White	100.0	62.7	3.0	0.5	1.7	13.4	18.7
Colored[1]	100.0	14.5	1.5	0.1	0.1	36.5	47.3

[1] Comprising 2 Chinese, 62 Indians, and 58,096 negroes.

In the period from 1880 to 1900 the total number of farms increased 140.1 per cent, the gain in the last decade being 67.4 per cent. Since 1890 the number of farms operated by owners has increased 26.5 per cent; by cash tenants, 146.2 per cent; and by share tenants, 101.5 per cent. The percentages shown in Table 4 indicate that the number of farms operated by owners has not increased so rapidly since 1880 as the number operated by tenants.

In 1900, 49.8 per cent of the farms were operated by white farmers, and 50.2 per cent, by colored farmers. Of the white farmers, 66.2 per cent owned all or part of the farms they operated, and 33.8 per cent operated farms owned by others. The corresponding percentages for colored farmers are 16.1 and 83.9.

In 1890, 61.8 per cent of all tenants were share tenants, and in 1900, 57.0 per cent. The relative number of farms rented for cash or for a share of the products is determined largely by the race of farmers and the kind of crops grown. In the parishes along the Mississippi River, where colored farmers predominate, and where cotton and cane are the principal products, cash tenants equal or exceed share tenants, while in the western parishes, where more diversified farming prevails, share tenants outnumber cash tenants. In parishes where local contract systems prevail, the distinction between cash and share tenure is hard to draw.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the number conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

TABLE 6.—NUMBER AND ACREAGE OF FARMS AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	115,969	95.4	11,059,127	100.0	$198,536,906	100.0

Share tenants	38,312	39.1	1,497,546	13.6	26,741,397	13.5

[1] Including 2 Chinese.

TABLE 7.—AVERAGE VALUE OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY RACE OF FARMER AND BY TENURE.

RACE OF FARMER, AND TENURE.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$929	$288	$246	$249	$571	33.3
White farmers	1,445	481	468	382	812	29.2
Negro farmers	416	96	25	117	330	50.5
Indian farmers[1]	347	59	17	128	259	47.1
Owners	1,105	385	258	356	662	31.5
Part owners	1,343	459	349	366	734	29.1
Owners and tenants	1,052	364	176	400	658	33.0
Managers	19,701	6,784	13,345	2,691	9,008	21.2
Cash tenants	564	143	44	162	425	46.5
Share tenants	462	97	25	114	334	47.8

[1] Including 2 Chinese.

In 1900, 21.2 per cent of the total acreage was operated by colored farmers, while less than 10 per cent was actually owned by them. The value of the farms operated by colored farmers was 19.1 per cent of the total state value of farm property, while the value of farms actually owned by negroes was less than 5 per cent. The large per cent of gross income shown in Table 7 for colored farmers is due to the smaller size and consequent more intensive cultivation of their farms, and to the lower value of their farm property or capital invested. It is also due in some degree to the fact that in many cases the most productive part of the plantations are rented in small areas to negroes and appear as the farms of colored tenants, while larger areas of less fertile land, comprising the remainder of the plantation, appear as the farms of white owners. The valuable buildings are all on the part retained, which tends to reduce the rate of income by increasing the base used in the computation.

Farms conducted by share tenants have the smallest average area, 39.1 acres, and those of managers the largest, 941.7 acres. The farms conducted by the last-named class are, as a rule, favorably located and highly improved, and the average values of the various forms of farm property, shown in Table 7, are much larger for this than for any other tenure group. The ratio which the gross income of these farms bears to the total value of farm property, however, is smaller than for the other groups, owing to the high average valuation of the land and buildings.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	115,969	95.4	11,059,127	100.0	$198,536,906	100.0
Under 3 acres	992	1.5	1,448	(1)	1,593,073	0.8
3 to 9 acres	4,730	6.7	31,586	0.3	2,803,705	1.4
10 to 19 acres	20,060	14.4	288,991	2.6	9,623,871	4.8
20 to 49 acres	44,622	29.8	1,330,953	12.0	30,208,673	15.2
50 to 99 acres	18,179	70.0	1,272,079	11.5	20,169,566	10.2
100 to 174 acres	15,633	137.6	2,150,489	19.5	21,191,849	10.7

500 to 999 acres	1,688	662.9	1,118,940	10.1	18,975,368	9.5
1,000 acres and over	1,050	2,297.6	2,412,525	21.8	66,657,104	33.6

[1] Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$929	$288	$246	$249	$571	33.3
Under 3 acres	752	524	62	268	832	51.8
3 to 9 acres	310	166	23	94	190	32.1
10 to 19 acres	275	94	19	92	291	60.7
20 to 49 acres	404	109	29	135	369	54.6
50 to 99 acres	629	190	51	239	483	43.5
100 to 174 acres	756	237	66	297	536	39.5
175 to 259 acres	1,318	379	116	433	694	30.9
260 to 499 acres	2,271	696	314	657	1,357	34.5
500 to 999 acres	6,124	1,907	1,950	1,260	2,324	20.7
1,000 acres and over	30,966	9,740	18,648	4,129	11,407	18.0

The group of farms of 1,000 acres and over contains the largest percentage of the total farm area. Over one-half of these farms are sugar or cotton plantations, and 288 of them are operated by managers. They report the highest average values of all forms of farm property and products, but on account of the high valuation of the property, the percentage of gross income on total investment is smallest for this group, though the gross income is in itself far in advance of that of any other group.

For the two groups of farms containing less than 10 acres each the average values given in Table 9 are relatively high, as these groups contain most of the florists' establishments of the state and a number of city dairies, poultry farms, and market gardens. It should be borne in mind that the income from these industries depends less upon the acreage of land used than upon the amount of capital invested in buildings and implements, and the amount expended for labor and fertilizers.

The average gross incomes per acre for the various groups classified by area are as follows: Farms under 3 acres, $569.72; 3 to 9 acres, $28.51; 10 to 19 acres, $20.23; 20 to 49 acres, $12.38; 50 to 99 acres, $6.90; 100 to 174 acres, $3.90; 175 to 259 acres, $3.31; 260 to 499 acres, $3.95; 500 to 999 acres, $3.51; 1,000 acres and over, $4.96.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading features of the statistics relating to farms classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop, and constitutes at least 40 per cent of the total value of products not fed to live stock, the farm is classified as a "hay and grain" farm. If vegetables are the leading crop, constituting 40 per cent of the value of the products, it is a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive 40 per cent of their income from any one class of products. Farms with no income in 1899 are classified according to the agricultural operations upon other farms in the same locality.

TABLE 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.

TABLE 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$929	$288	$246	$249	$571	33.3
Hay and grain	1,170	401	190	224	279	14.1
Vegetables	965	358	61	155	508	33.0
Fruits	743	387	68	207	549	39.1
Live stock	929	341	108	485	368	19.8
Dairy produce	1,579	641	120	521	846	29.6
Tobacco	860	414	64	284	508	31.4
Cotton	501	141	37	170	422	49.7
Rice	2,466	427	303	467	1,581	43.2
Sugar	8,544	2,849	5,579	1,227	4,304	23.6
Flowers and plants	2,717	889	129	33	1,911	50.7
Nursery products	4,333	1,480	268	241	4,291	67.9
Miscellaneous	735	239	72	267	349	26.6

For the several classes of farms the average values per acre of products not fed to live stock are as follows: For farms deriving their principal income from flowers and plants, $506.16; nursery products, $30.59; sugar, $13.77; rice, $9.70; dairy produce, $9.33; vegetables, $9.21; tobacco, $7.91; fruits, $6.53; cotton, $5.87; hay and grain, $2.74; miscellaneous, $2.51; and live stock, $2.41.

The wide variations shown in the averages and in the percentages of gross income are largely due to the fact that in computing gross income no deduction is made for expenditures. For florists' establishments, nurseries, and market gardens the average expenditure for such items as labor and fertilizers represents a far larger percentage of the gross income than in the case of "hay and grain," "live stock," or "miscellaneous" farms. Were it possible to present the average net incomes, the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by the reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.

TABLE 13.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$929	$288	$246	$249	$571	33.3
$0	533	135	62	97	....	....
$1 to $49	323	93	20	74	25	4.9
$50 to $99	317	97	23	89	70	13.3
$100 to $249	339	113	26	122	200	33.4
$250 to $499	499	156	38	188	373	42.4
$500 to $999	904	267	80	323	743	47.2
$1,000 to $2,499	2,234	641	226	634	1,503	40.2
$2,500 and over	16,647	5,304	9,416	2,454	8,393	24.8

The absence of income in the first group is due in part to the fact that the enumerators could not always secure complete reports for farms where changes in ownership or tenancy had occurred shortly prior to the date of enumeration. The persons in charge of such farms on June 1, 1900, could not always give definite information concerning the products of the preceding year. The same statement is true, also, of some of the farms with reported incomes of less than $100. To this extent the reports fall short of giving a complete statement of farm income in 1899.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the census of 1900. The age grouping for neat cattle was determined by their present and prospective relations to the dairy industry and to the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits very close comparison with previous census reports.

Table 14 presents a summary of live-stock statistics.

TABLE 14.—DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age in years.	ON FARMS.			NOT ON FARMS.
		Number.	Value.	Average value.	Number.
Calves	Under 1	169,825	$817,872	$4.82	7,380
Steers	1 and under 2.	57,344	470,339	8.20	1,618
Steers	2 and under 3.	30,094	343,357	11.41	870

Horses	2 and over	168,786	6,184,115	36.64	25,255
Mule colts	Under 1	2,325	52,950	22.77	79
Mules	1 and under 2.	6,225	293,765	47.19	104
Mules	2 and over	135,420	10,290,267	75.99	6,829
Asses and burros	All ages	683	51,685	75.67	270
Lambs	Under 1	50,610	49,746	0.98	346
Sheep (ewes)	1 and over	114,414	185,840	1.62	960
Sheep (rams and wethers).	1 and over	54,820	97,454	1.78	793
Swine	All ages	788,425	1,494,284	1.90	24,392
Goats	All ages	38,308	35,697	0.93	2,091
Fowls:[1]					
Chickens[2]	....	3,890,563	1,057,889	....	....
Turkeys	....	115,921			
Geese	....	169,936			
Ducks	....	123,059			
Bees (swarms of)	....	35,231	54,316	1.54	....
Value of all live stock	....	....	28,869,506	....	....

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.

[2] Including Guinea fowls.

The value of all live stock on farms, June 1, 1900, was $28,869,506. Of this amount, 36.8 per cent represents the value of mules; 23.0 per cent, that of horses; 17.2 per cent, that of neat cattle other than dairy cows; 12.5 per cent, that of dairy cows; 5.2 per cent, that of swine; 3.7 per cent, that of poultry; and 1.6 per cent, that of all other live stock.

No reports were secured of the value of live stock not on farms, but it is probable that such animals have higher average values than those on farms. Allowing the same average values, however, the value of live stock not on farms would be $1,962,128, and the total value of live stock in the state, exclusive of poultry and bees not on farms, would be approximately $30,831,634.

CHANGES IN LIVE STOCK ON FARMS.

The following table shows the changes since 1850 in the number of the most important classes of live stock.

TABLE 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS: 1850 to 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	184 815	485,480	194,372	144,653	169,234	788,425
1890	167,223	413,880	126,777	88,028	186,167	569,935
1880	146,454	324,147	104,428	76,674	135,631	633,489
1870	102,076	233,185	59,738	61,338	118,602	338,326
1860	129,662	387,145	78,703	91,762	181,253	634,525
1850	105,576	469,766	89,514	44,849	110,333	597,301

[1] Lambs not included.

In the Civil War decade all classes of live stock show decreases in numbers, but by the year 1880 practically all, with the exception of neat cattle, had regained the numbers reported in 1850. Uninterrupted progress since 1870 is shown in the numbers of all neat cattle, horses, and mules. For the last decade increases in number are as follows: Dairy cows, 10.5 per cent; other neat cattle, 17.3 per cent; horses, 53.3 per cent; mules and asses, 64.3 per cent; and swine, 38.3 per cent. A decrease of 9.1 per cent in the number of sheep is shown for the last decade.

Although the enumerators in 1900 were instructed to report no fowls under three months old, and no such limitation was made in previous census reports, the last decade shows the following increases in the numbers of fowls: Ducks, 83.4 per cent; chickens, 73.2 per cent; turkeys, 55.2 per cent; and geese, 13.8 per cent.

ANIMAL PRODUCTS.

Table 16 is a summarized statement of the products of the animal industry in 1899.

TABLE 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	547,641	$90,317
Mohair and goat hair	Pounds	385	92
Milk	Gallons	[1]39,251,413	[2]4,168,015
Butter	Pounds	4,918,229	
Cheese	Pounds	135,104	
Eggs	Dozens	12,820,290	1,281,713
Poultry			1,425,116
Honey	Pounds	426,490	45,200
Wax	Pounds	20,440	
Animals sold			1,072,869
Animals slaughtered			1,929,437
Total			10,012,759

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of milk sold and consumed, and of butter and cheese made.

The value of animal products in 1899 was $10,012,759, or 13.8 per cent of the value of all farm products, and 15.1 per cent of the gross farm income. Of the total value, 41.6 per cent represents the value of dairy products; 30.0 per cent, that of animals sold and animals slaughtered on farms; 27.0 per cent, that of poultry and eggs; 0.9 per cent, that of wool, mohair, and goat hair; and 0.5 per cent, that of honey and wax.

DAIRY PRODUCE.

In 1899, 1,646 farmers, or 1.4 per cent of all in the state, derived their principal income from the sale of dairy produce. Of the $4,168,015 given in Table 16, as the value of all dairy produce, $3,059,959, or 73.4 per cent, represents the value of such produce consumed on farms, and $1,108,056, or 26.6 per cent, the receipts from sales. Of the latter amount, $986,824 was received from the sale of 4,356,979 gallons of milk; $109,774, from 564,250 pounds of butter; $8,770, from 116,177 pounds of cheese; and $2,688, from 3,853 gallons of cream.

The great progress in dairying since 1890 is shown by the fact that in 1900 more than three times as much milk, twice as much butter and thirty-four times as much cheese made on farms, were reported as in 1890.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

The value of animals sold and animals slaughtered on farms in 1899 was $3,002,306, or 4.1 per cent of the value of all farm products. Animals slaughtered were reported by 48,339 farmers, or 41.7 per cent of all in the state, the average value per farm being $39.91. Sales of animals were reported by 17,600 farmers, or 15.2 per cent, the average value per farm being $60.96. In obtaining these reports the enumerators were instructed to secure from each farm operator a statement of the amount received from sales in 1899, less the amount paid for animals purchased during the same year.

POULTRY AND EGGS.

The production of eggs in 1899 was more than twice as great as in 1889. The three parishes, St. Landry, Vermilion, and Lafayette are first in poultry products, each reporting more than 800,000 dozen eggs for the year 1899. The total value of poultry products was $2,706,829, of which 52.6 per cent represents the value of poultry raised, and 47.4 per cent, that of eggs produced.

WOOL.

Each decade since 1870 shows an increased production of wool, the product of 1899 being 106,955 pounds greater than that of 1889, a gain of 24.3 per cent. The following parishes in the southern part of the state, ranking in the order named, report more than half the state total of wool for 1899: Calcasieu, Vernon, St. Tammany, St. Landry, Rapides, Tangipahoa, and Washington.

HONEY AND WAX.

In 1899 there were reported 426,490 pounds of honey and 20,440 pounds of wax, while in 1889 the production was 271,962 pounds of honey and 8,584 pounds of wax.

HORSES, MULES, AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses, mules, and dairy cows, and the average number of these animals per farm. In computing the averages presented, only those farms which report the kind of live stock under consideration are included.

TABLE 17.—HORSES, MULES, AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.		MULES.		DAIRY COWS.	
	Farms reporting.	Average per farm.	Farms reporting.	Average per farm.	Farms reporting.	Average per farm.
Total	82,289	2.4	53,948	2.7	63,967	2.9
White farmers	48,130	2.8	24,858	4.0	43,270	3.4
Colored farmers	34,159	1.8	29,090	1.5	20,697	1.9
Owners[1]	40,536	2.8	22,044	3.1	37,957	3.4
Managers	837	5.4	810	26.1	711	5.5

Share tenants	21,556	1.9	15,949	1.6	13,517	1.8
Under 20 acres	14,229	1.7	8,688	1.2	7,500	2.7
20 to 99 acres	44,857	2.1	29,266	1.8	33,529	2.3
100 to 174 acres	12,942	2.6	7,924	1.9	12,855	3.1
175 to 259 acres	4,127	3.1	2,961	3.1	4,258	3.8
260 acres and over	6,134	4.8	5,109	10.9	5,825	5.3
Hay and grain	4,098	2.2	2,110	3.3	2,857	2.5
Vegetable	1,873	1.8	729	2.3	1,070	2.3
Fruit	508	1.9	115	1.7	424	2.8
Live stock	6,322	3.7	2,714	2.8	6,002	3.5
Dairy	1,469	3.1	441	2.7	1,646	9.6
Cotton	52,362	2.1	39,307	1.9	38,278	2.5
Rice	2,311	4.0	1,268	5.0	1,710	3.1
Sugar	3,342	3.1	3,314	10.9	2,367	3.1
Miscellaneous[2]	10,004	2.6	3,950	2.3	9,613	3.1

[1] Including "part owners" and "owners and tenants."
[2] Including tobacco farms, florists' establishments, and nurseries.

In Louisiana, as in all states where cotton is a staple crop and much of the farm labor is performed by negroes, large numbers of mules are used as work animals. For most classes of farms the average number of mules exceeds that of horses. If the numbers of horses and mules be combined, the average number of work animals per farm compares favorably with the corresponding figures for the more intensively cultivated farms of New England.

CROPS.

The following table gives the statistics of the principal crops grown in 1899.

TABLE 18.—ACREAGE, QUANTITIES, AND VALUES OF PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantity.	Value.
Corn	1,343,756	Bushels	22,062,580	$10,327,723
Wheat	214	Bushels	2,345	1,888
Oats	28,033	Bushels	316,070	117,312
Barley	16	Bushels	110	61
Rye	55	Bushels	372	323
Broom corn	107	Pounds	41,120	2,130
Rice	201,685	Pounds	172,732,430	4,044,489
Clover seed		Bushels	7	35
Grass seed		Bushels	264	465
Hay and forage	97,136	Tons	248,601	1,353,118
Cottonseed		Tons	[1]338,388	3,481,669
Cotton	1,376,254	Bales	709,041	23,523,143
Tobacco	275	Pounds	102,100	20,488
Peanuts	3,107	Bushels	45,713	44,785
Dry beans	335	Bushels	3,371	3,948
Dry pease	15,190	Bushels	146,298	156,843
Potatoes	9,220	Bushels	549,280	309,082
Sweet potatoes	27,372	Bushels	1,865,482	$859,733
Onions	1,655	Bushels	152,683	106,426
Miscellaneous vegetables	24,851			1,647,424
Sugar cane	276,966	Tons	3,137,338	
a. Cane sold		Tons	1,038,496	3,533,507
b. Cane kept for seed		Tons	1,013,984	3,483,633
c. Sugar made		Pounds	156,072,199	6,399,187
d. Molasses made		Gallons	6,213,859	782,271
e. Sirup made		Gallons	1,552,641	428,684
Sorghum cane	937	Tons	[1]1,160	3,423
Sorghum sirup		Gallons	48,727	14,944
Small fruits	1,408			172,803
Grapes	[2]85	Centals	1,770	[3]5,927
Orchard fruits	[2]12,686			[4]225,476
Tropical fruits				8,727
Nuts				51,457
Forest products				1,381,867
Flowers and plants	89			76,628
Seeds	36			5,000
Nursery products	276			63,593
Miscellaneous	7			16,331
Total	3,421,751			62,654,543

[1] Exclusive of 11,515 tons, valued at $118,490, sold in seed cotton and included with the cotton.

[1] Sold as cane.
[2] Estimated from number of vines or trees.
[3] Including value of raisins, wine, etc.
[4] Including value of cider, vinegar, etc.

Of the total value of crops, cotton and cottonseed contributed 43.1 per cent; sugar cane and sugar cane products, 23.3 per cent; cereals, including rice, 23.1 per cent; miscellaneous vegetables, 2.6 per cent; hay and forage, 2.2 per cent; forest products, 2.2 per cent; sweet potatoes, 1.4 per cent; and all other products, 2.1 per cent.

The average values per acre of the various crops are as follows: Flowers and plants, $861; nursery products, $230; small fruits, $123; tobacco, $75; miscellaneous vegetables, $66; onions, $64; sugar cane and sugar cane products, $53; potatoes, $34; sweet potatoes, $31; cotton and cottonseed, $20; sorghum cane and sorghum sirup, $20; orchard fruits, $18; peanuts, $14; dry pease, $10; and cereals, including rice, $9.

The crops yielding the highest average returns per acre were grown upon very highly improved land. Their production requires a relatively great amount of labor and large expenditures for fertilizers.

COTTON.

The following table is a statement of the changes in cotton production since 1849.

TABLE 19.—ACREAGE AND PRODUCTION OF COTTON: 1849 TO 1899.

YEAR.	ACREAGE.		PRODUCTION.		
	Total.	Per cent of increase.	Commercial bales.	Pounds.	Per cent of increase.
1899	1,376,254	8.4	709,041	349,760,572	11.2
1889	1,270,154	46.9	659,180	314,428,860	36.5
1879	864,787		508,569	230,381,757	51.3
1869			350,832	152,261,088	[1]56.0
1859			777,738	346,093,410	384.1
1849			178,737	71,494,800	

[1] Decrease.

In 1859 Louisiana produced more than four times the amount of cotton reported for 1849, but in the next decade the state suffered from the effects of the Civil War, and the cotton crop decreased 56.0 per cent. The decades following have shown a rapid increase, though the percentage of gain has become smaller with each succeeding census. The parishes in which decreases are shown for the last decade are located in the northeastern part of the state.

In 1899, 88,328 farmers reported a total area of 1,376,254 acres devoted to cotton, 29.5 per cent of the total improved farm land of the state, and an average of 15.6 acres per farm. This land produced 349,760,572 pounds of lint, an average of 254 pounds per acre, 7,701 pounds per square mile of land service for the state, and 253 pounds per capita. The total value of the crop of 1899, including both lint and seed, was $27,004,812, the average value of these products being $305.73 per farm reporting and $19.62 per acre.

The parishes having the largest area devoted to cotton in the last decade were St. Landry, Caddo, Claiborne, Bossier, De Soto, Natchitoches, Avoyelles, Morehouse, and Pointe Coupee, ranking in the order named, and reporting 39.6 per cent of the total acreage.

SUGAR CANE.

Table 20 presents a comparative statement of the acreage of sugar cane and the production of sugar and sirup: 1849 to 1899.

TABLE 20.—ACREAGE OF SUGAR CANE AND PRODUCTION OF SUGAR AND SIRUP: 1849 TO 1899.

YEAR.[1]	Acreage in cane.	SUGAR.		SIRUP.	
		Production in pounds.	Average yield per acre in pounds.	Production in gallons.	Average yield per acre in gallons.
1899	276,966	156,072,199	563.5	7,766,500	28.0
1889	193,694	292,124,050	1,508.2	14,341,081	74.0
1879	181,592	206,047,200	1,134.7	11,696,248	64.4
1869	....	96,847,200	....	4,585,150	....
1859	....	266,071,200	....	13,439,772	....
1849	....	271,201,200	....	....	....

[1] No statistics of acreage were secured prior to 1879.

Of the 3,421,751 acres of land under cultivation in 1899, 277,903, or 8.1 per cent, were used for growing cane for the production of sugar, molasses, and sirup. Of this acreage, 276,966, or over 99.7 per cent, were devoted to cane, which, because it was introduced from the West Indies, is often called the West India cane, but is more often designated "ribbon cane," from its appearance. The remaining 937 acres, or 0.3 per cent, were used for growing sorghum cane, sometimes, though improperly, spoken of as Chinese sugar cane, by reason of its introduction from China.

NUMBER AND CHARACTER OF FARMS RAISING CANE.

Of the 115,969 farms reported in Louisiana, June 1, 1900, 13,870, or 12.0 per cent, raised cane used for making sugar or sirup. Of this number 11,763, or 84.8 per cent, grew sugar cane, with an average area per farm reporting of 23.5 acres, and 2,107, or 15.2 per cent, grew sorghum cane, the average area per farm being 0.4 of an acre. The area devoted to sugar cane has increased 42.9 per cent, while that devoted to sorghum cane has decreased 46.6 per cent since 1889. In addition, 11 large plantations and a great number of smaller farms raised cane used for seed, but made no sugar or sirup. The record of these operations with growing cane was not given upon the schedules.

The total farm value of sugar cane and sorghum cane in 1899, including in that total the receipts from sales of cane, the value of sugar cane reserved for seed and that of sugar, sirup, and molasses made by planters from cane which they grew, but not including the value of the sugar, etc., made from purchased cane, was $14,645,649. Of this amount, $14,627,282 represents the value of sugar cane and its products, and $18,367 that of sorghum cane and its products. The average value, as above described, of sugar cane per farm growing it, was $1,243, while the average of sorghum cane was less than $9; the average values per acre being $52.81 and $19.60, respectively.

Of the 11,774 farms growing sugar cane, 3,870 made its cultivation their principal source of income, and are here spoken of as sugar farms. The remainder, 7,904, made the growing of sugar cane a subordinate branch of agriculture. Sorghum is grown by few, if any, farmers as their principal source of income, but only as an incidental product in connection with other farming operations. It is principally grown in parishes in which the sugar cane does not flourish, Claiborne and Union parishes reporting 39.4 per cent of the total acreage and 46.4 per cent of the total value of the product.

Of the farmers growing sugar cane in 1899, 281 manufactured sugar and molasses therefrom. Of that number, 274 manufactured large quantities, while the manufacturing operations of the remaining 7 were insignificant.

Sirup was manufactured on 5,332 farms, and on 6,150 cane was sold, but no sugar or sirup manufactured. Cane was raised by many farmers from whom no reports were received. Their cane fields were so badly injured by frost that they harvested barely sufficient cane for seed, and as they sold no cane and made no sirup or sugar, the enumerators thought there was nothing to report. Among the plantations having expensive sugarhouses and machinery, there were 18 that made no sugar in 1899, owing to the frost and its consequent damage to cane. There were also 6 of the same class of plantations which, by reason of the frost, raised no cane excepting that reserved for seed, but purchased from others for sugar making. There were also 22 plantations that grew cane and made sirup exclusively. These 46 plantations in this bulletin will be grouped with the 274 which in 1899 manufactured sugar in large quantities, and are referred to as the 320 leading plantations. In this connection mention is made of 8 central refineries, 6 producing sugar and 2 reducing sirup to sugar for farmers but not cultivating any cane. They are considered as part of the sugar industry of the state, but not to be included in the statistics of agriculture proper. Of the 274 plantations making sugar in considerable quantities in 1899, 79 grew cane but did not purchase any, and 195 grew cane and also purchased it.

Of the 2,123,354 tons of cane converted into sugar by these plantations in 1899, 1,072,468 tons were grown by the manufacturers of the sugar on their own land by labor hired by themselves; 314,361 tons were grown on the plantations by tenants and purchased from them by the planter for use in his sugarhouse; and 736,425 tons were purchased by them and by the 8 central refineries from others. Of the total cane converted into sugar, 56.7 per cent was grown by the manufacturers, 8.6 per cent by the tenants, and 34.7 per cent by others. In the crop year 1898 the 351 central factories and large plantations converted 4,677,174 tons of cane into sugar. Of that quantity, 2,844,321 tons, or 60.8 per cent, were grown by owners of the sugarhouses; 350,699 tons, or 7.5 per cent, by their tenants; and 1,482,154 tons, or 31.7 per cent, were purchased from others. No tabulation was made of the relative amount of cane converted into sirup in 1898 or 1899 that was grown by the planters making it, by tenants, or purchased from others.

VALUE AND INCOME OF SUGAR PLANTATIONS.

The 3,870 plantations and farms making the sugar industry their principal source of income in Louisiana constituted only 3.3 per cent of the total number. They contained 1,209,837 acres of land, or 10.9 per cent of all land. The lands with their improvements, exclusive of buildings, had a value of $33,063,960; the value of the buildings was $11,027,060; implements and machinery, including apparatus for making sugar and railroads for handling cane, $21,591,940; and the live stock, $4,747,109; making a total fixed capital of $70,430,069, or 35.5 per cent of all the fixed capital in Louisiana agriculture. The corresponding investments of 79,468 cotton farms was $67,505,143, and of the other 32,631 farms, $60,601,694. The sugar farms numbered 3.3 per cent of all, and controlled 35.5 per cent of all the fixed capital; the cotton plantations numbered 68.5 per cent, and controlled 34.0 per cent of the capital; and the other plantations constituted 28.2 per cent of all, and controlled 30.5 per cent of all capital.

The sugar plantations reported farm products, including those fed to live stock, of a value of $18,019,470; the cotton plantations, of $36,823,212; and other plantations, $17,824,620. The products not fed, or gross farm income, for the three classes of farms amounted to $16,656,300, $33,523,192, and $15,959,340, respectively. These were 23.6, 49.7, and 26.3 per cent, respectively, of the total fixed capital invested in each class.

The expenditures of those 3,870 farms making sugar their chief source of income were, for labor, $6,931,470, and for fertilizers, $709,970, making a total of $7,641,440, or 45.9 per cent of the gross income of the farms, or the value of products less those fed to live stock. The cane kept for seed had a value at the sugarhouse for sugar making of $3,430,930. Mention is made of this large value to show the immense relative and actual cost of seeding to the Louisiana sugar planter as compared with that of the planters of Hawaii and Cuba. In Hawaii the tops are utilized for seed, and in Cuba the lands need reseeding, as a rule, only once in twenty years or more, the cost in either case being comparatively small. The $3,430,930 represents, therefore, the added cost of sugar making in Louisiana for a single year as compared with Hawaii and Cuba, and shows why under equal terms otherwise the planters of Louisiana can not compete successfully in sugar production with those of the islands mentioned. This value of the seed cane is not to be included with that of labor and fertilizers in the total expenses of the farm, because it is already included in the value of the labor and fertilizers used in its production. No reports were secured of the expenses of the 3,870 sugar farms outside of those of labor and fertilizers. Such statements were obtained, however, from 328 of the most important plantations and central factories which converted into sugar the cane grown in 1899.

COST OF RAISING CANE AND MAKING SUGAR.

The 320 leading planters in Louisiana who grew cane extensively in the year 1899 reported expenses for growing the 1,072,468 tons of cane grown by them on their own plantations, as follows: For labor, including salaries, $4,194,862; for fertilizers, $468,589; for feed purchased, $481,502; for maintenance and labor on plantation railroads, $116,276—a total of $5,261,229, and an average of $4.91 per ton utilized for sugar making. The average contract rate at which cane was purchased by the sugarhouses in 1899 was $3.56. After making allowance for the unreported farming expenses alluded to above, there was a margin loss of more than $1.35 a ton of cane converted into sugar in the field operations of 1899. This loss was owing to the severe frost that visited Louisiana in the early part of the year, and so damaged the crop as to leave many planters with barely sufficient cane for seed. The crop year 1898 presented many sharp contrasts with that of 1899. The year 1898 was a very wet season, the cane grew luxuriantly, and after deducting the usual amount for seed there was left a large quantity for delivery to the sugarhouses. The planters who grew only 1,072,468 tons in 1899 for sugar making delivered to the sugarhouses in the preceding year twice that amount, or

2,844,321 tons. The cultivation of the land, including the planting of the cane, cost about the same in the two years, the only extra expense for 1898 being for cutting and handling the extra quantity of cane. The contract price for the cane was $3.41 per ton, and this, with the great quantity raised, left a margin of profit in the field operations.

Of the large sugarhouses located on plantations and of central refineries purchasing all the cane converted by them, 351 were in operation for reducing the crop of 1898, and 310 were in operation for reducing the crop of 1899. The expenses of operating the 351 sugarhouses for the crop of 1898 (exclusive of the cost of cane purchased) were as follows: For labor, including salaries, $3,548,982; for fuel, $1,688,295; for mill supplies, $106,162; for freight expenses, $291,309; for taxes, $437,398; and insurance, interest, repairs, rent of office, and miscellaneous expenses, $1,842,197; total, $7,914,343. This was an average, for each of the 4,677,174 tons converted into sugar, of $1.69.

For the crop of 1899 the expenses of the sugarhouses were: For labor and salaries, $1,316,814; fuel, $644,665; mill supplies, $50,627; freight, $134,172; taxes, $305,355; and insurance, interest, repairs, and miscellaneous expenses, $949,935; total, $3,401,568; an average of $1.60 for each of the 2,123,354 tons converted into sugar.

For the crop year 1898 the sugar output had a value of $5.19 per ton of cane converted; in 1899, $7.11. There was, therefore, a small margin of gain in the sugarhouse operations connected with the crop of 1898, and a large gain for those of 1899. The small gain in the former year was due to the large content of water and the small content of sugar caused by the exceedingly wet season, while the large profit of the succeeding year came from the reverse conditions. Considering the field and sugarhouse work as a unit, the raising of cane and converting it into sugar yielded a good net profit in both 1898 and 1899. The exact amount of the former profit can not be determined from the reports, but in 1899 the growers of cane lost $1.35 a ton on all they raised, and the manufacturers of sugar made $1.95 on every ton of cane handled at the average cost of purchase. The net profit in the industry was the difference, or 60 cents a ton for the cane converted, from which must be deducted the interest on investment and allowance made for unreported expenses above mentioned. This profit was enjoyed by only the 310 owners of plantations and central refineries reducing cane. The other 3,568 farmers growing cane as their principal source of income suffered a very great loss. In both the crop years, 1898 and 1899, the largest profit was realized by the establishment with the most modern appliances; some of the others lost money both years.

PLANT AND RATTOON CANE.

In the crop year 1899 the area of cane used for sugar making and seed by the 320 leading plantations was, for plant cane, 59,246 acres; first year rattoon, 61,977 acres; and for second year rattoon, 5,922 acres. Of tons of cane used for sugar making there were, of plant cane, 873,315 tons; first year rattoon, 189,211 tons; and second year rattoon, 9,942 tons. Reserved for seed, plant cane, 96,025 tons; first year rattoon, 339,410 tons; and second year rattoon, 33,069 tons. The per cent of all cane used on these 320 plantations for seed in 1899 was 30.4.

SUGAR AND MOLASSES MADE IN 1899.

The total quantity of sugar made in Louisiana from cane grown in 1899 was 319,166,396 pounds, valued at $13,099,559. Of sirup there was made a total of 2,480,856 gallons, valued at $564,842. In addition, the planters reported 923,466 gallons of sirup, valued at $157,391, that was later converted in factories into sugar. Of molasses there was produced 11,703,877 gallons, valued at $1,277,384. Of the sugar, 8,874,929 pounds were made by the old process of the open kettle and 310,291,467 pounds by modern processes; 251,789,270 pounds were classed as firsts, 47,984,887 pounds, as seconds, and 10,517,310 pounds, as thirds.

For the crop year 1898 there was produced on the large plantations and in the central refineries for cane grown and purchased, a total of 556,994,942 pounds of sugar, valued at $22,197,168, and 24,164,689 gallons of molasses, valued at $1,661,897, and 2,774,961 gallons of sirup, valued at $432,481. Of the sugar made by modern processes, 437,370,968 pounds were firsts; 87,523,291 pounds, seconds; and 14,196,078 pounds, thirds; 17,904,605 pounds were made by the open kettle process.

LOSSES TO PLANTERS BY FROSTS IN 1899.

The very heavy frost of the early part of 1899 destroyed a large part of the cane planted in the fall of 1898, and extensively injured the rattoon cane, which constitutes a large part of the crop in Louisiana. The effect of this injury was far reaching; it not only greatly shortened the crop used for sugar making, but by destroying the stubble (rattoon cane), made necessary the replanting of a much larger area than usual, requiring the saving of a greatly increased quantity of cane for seed.

The reports furnished by the proprietors of the 320 large plantations considered in this report show an estimated loss of 297,491,424 pounds of sugar, or very nearly one-half of the entire crop, a cause amply sufficient to account for the net loss of 81 cents per ton, sustained by the growers.

CEREALS.

Table 21 is a statement of the changes in cereal production since 1849.

TABLE 21.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899.

PART 1.—ACREAGE.

YEAR.[1]	Barley.	Corn.	Oats.	Rice.	Rye.	Wheat.
1899	16	1,343,756	28,033	201,685	55	214
1889	41	837,516	27,023	84,377	73	41
1879	....	742,728	26,861	42,000	201	1,501

PART 2.—BUSHELS PRODUCED.[2]

YEAR.[1]	Barley.	Corn.	Oats.	Rice.	Rye.	Wheat.
1899	110	22,062,580	316,070	172,732,430	372	2,345
1889	598	13,081,954	297,271	75,645,433	374	257
1879	....	9,889,689	229,840	23,188,311	1,013	5,034
1869	1,226	7,596,628	17,782	15,854,012	984	9,906
1859	224	16 853,745	89,377	6,331,257	36,065	82,208
1849	....	10,266,373	89,637	4,425,349	475	417

[1] No statistics of acreage were secured prior to 1879.
[2] Rice reported in pounds.

The total area devoted to cereals in 1879 was 813,291 acres; that in 1889, 949,071 acres; and in 1899, 1,573,759 acres, an increase for the twenty years of 93.5 per cent. The increases in the areas devoted to the various cereals in the decade from 1889 to 1899 were as follows: Wheat, over fivefold; rice, 139.0 per cent; corn, 60.4 per cent; and oats, 3.7 per cent. Rye decreased 24.7 per cent, and barley, 61.0 per cent.

Of the total area under cereals in 1899, 85.4 per cent was devoted to corn; 12.8 per cent, to rice; 1.8 per cent, to oats; and less than one-tenth of 1 per cent to wheat, rye, and barley.

Exclusive of rice, the total number of bushels of cereals reported in 1849 was 10,356,902, and in 1899, 22,381,477, an increase of 116.1 per cent in the half century. The production of rice in 1899 was about thirty-nine times as great as in 1849.

Corn and oats were reported from nearly all parts of the state. Wheat was grown in 11 parishes in the northern and central portions of the state, the two parishes of Bienville and De Soto contributing 56.5 per cent of the total acreage. Rye was grown in 10 parishes in the northern part of the state, and barley in 3 parishes, Caddo parish furnishing 87.5 per cent of the total acreage of the latter cereal.

The introduction of improved machinery has resulted in a transfer of the rice-growing industry from the Mississippi delta parishes, where the subsoil is too soft to permit the use of heavy modern reapers, to the southwest prairie parishes where an impervious clay subsoil soon becomes solid after the water is drawn off. Assumption, Ascension, and St. Mary parishes, which in 1890 reported 15.4 per cent of the total production, in 1900 reported only 1.5 per cent of the total. Acadia, Calcasieu, and Vermilion contributed 23.5 per cent of the crop of 1889 and 68.3 per cent of the crop of 1899.

HAY AND FORAGE.

In 1900, 14,635 farmers, or 12.6 per cent of the total number, reported hay and forage crops. Exclusive of cornstalks and corn strippings, an average yield of 1.7 tons per acre was obtained. The acreage in hay and forage in 1899 was 97,136, or 252.2 per cent greater than ten years before. Of the area mown, 66,823 acres, or 68.8 per cent, produced 112,481 tons of grains cut green for hay.

In 1899 the acreages and yields of the various other kinds of hay and forage were as follows: Wild, salt, and prairie grasses, 5,086 acres and 6,278 tons; millet and Hungarian grasses, 426 acres and 728 tons; alfalfa or lucern, 2,365 acres and 4,156 tons; clover, 1,637 acres and 2,769 tons; other tame and cultivated grasses, 14,724 acres and 19,606 tons; forage crops, 6,075 acres and 17,425 tons; cornstalks and corn strippings, 84,607 acres and 85,158 tons.

In Table 18 the production of cornstalks and corn strippings is included under "hay and forage," but the acreage is included under "corn," as the forage secured was an incidental product of the corn crop.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 are shown in the following table.

TABLE 22.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900	1890	1899	1889
Apples	138,833	101,848	68,735	117,748
Apricots	674	584	89	469
Cherries	2,976	750	336	901
Peaches	758,877	317,182	153,808	310,217
Pears	74,669	9,807	29,405	3,993
Plums and prunes	186,158	91,602	29,682	17,977

In 1900, 7,288 farmers reported 1,168,792 fruit trees, while in 1890 the total number of trees was 521,723, the increase in the decade being 647,069, or 124.0 per cent. The number of pear trees has increased to nearly eight times that reported in 1890. The gains in the other varieties were as follows: Cherry trees, 296.8 per cent; peach trees, 139.3 per cent; plum and prune trees, 103.2 per cent; apple trees, 36.3 per cent; and apricot trees, 15.4 per cent.

Of the total number in 1900, 64.9 per cent were peach trees; 15.9 per cent, plum and prune trees; 11.9 per cent, apple trees; 7.3 per cent, pear, apricot, cherry, and unclassified fruit trees, the last-named class, which is not given in Table 20, numbering 6,605 trees and yielding 1,032 bushels of fruit.

The three adjacent parishes of Claiborne, Lincoln, and Webster, in the extreme northern part of the state, report 29.3 per cent of the total number of trees. Morehouse parish, in the northeastern part of the state, is the only parish reporting no fruit trees in 1900. The southeastern parish of Jefferson, which reported no fruit trees in 1890, reported more than 6,000 trees in 1900, ranking first in the number of cherry trees. As a rule, however, the semitropical fruits receive more attention in the southern part of the state than do the temperate fruits.

The value of orchard products, given in Table 18, includes the value of 101 barrels of cider, 77 barrels of vinegar, and 5,020 pounds of dried and evaporated fruit. The quantity of fruit produced in any given year is determined largely by the nature of the season. Comparisons between the crop of 1889 and that of 1899 have little significance, because in the latter year there was an almost complete failure of peaches and apricots, and very small yields of other fruits.

SMALL FRUITS.

The total area used in the cultivation of small fruits in 1899 was 1,408 acres, distributed among 932 farms, an average of 1.5 acres per farm. Of the total acreage, 1,395 acres, or 99.1 per cent, were devoted to strawberries, with a production of 1,841,800 quarts, 90.2 per cent of these berries being raised in Tangipahoa parish, where the average area per farm reporting was 2.4 acres. The production of other berries was as follows: Blackberries and dewberries, 10,170 quarts; raspberries and Logan berries; 110 quarts; gooseberries, 50 quarts; currants, 50 quarts; and other small fruits, 4,330 quarts.

VEGETABLES.

The total area used in the cultivation of vegetables, including potatoes, sweet potatoes, and onions, in 1899 was 63,098 acres. Of the acreage, 43.4 per cent was devoted to sweet potatoes; 14.6 per cent, to potatoes; 2.6 per cent, to onions; and 39.4 per cent, to miscellaneous vegetables. To sweet potatoes 29,014 farmers devoted 27,372 acres, producing 1,865,482 bushels, an average of 68.2 bushels per acre. They were grown throughout the state, but the southwestern parishes of Acadia, Calcasieu, Iberia, St. Landry, and St. Martin report 25.9 per cent of the product, and 32.1 per cent of the acreage. The area devoted to potatoes was 9,220 acres, yielding 549,280 bushels, an average of 59.6 bushels per acre.

The total area devoted to miscellaneous vegetables was 24,851 acres, of which the products grown on 14,648 acres were not reported in detail. Of the remaining 10,203 acres, 2,705 acres were devoted to watermelons; 1,993, to cabbages; 1,297, to sweet corn; 1,021, to muskmelons; 807, to cucumbers; 697, to tomatoes, 619, to beans; 288, to radishes; 162, to pease; 155, to beets; 135, to turnips; and 324, to other vegetables.

TOBACCO.

According to the census of 1850, Louisiana produced in 1849, 26,878 pounds of tobacco. The census of 1860 showed a gain of 13,062 pounds, or 48.6 per cent, and that of 1870, a loss of 24,399 pounds, or 61.1 per cent. Between 1870 and 1880 there was an increase of 40,413 pounds, or 260.0 per cent, while in the next decade there was a decline of 9,109 pounds, or 16.3 per cent.

The present census shows that in 1899 tobacco was grown in Louisiana by 522 farmers, who obtained from 275 acres a yield of 102,100 pounds. This was an increase over the crop area of 1889 of 166 acres, or 152.3 per cent, and a gain in production of 55,255 pounds, or 118.0 per cent. The total value of the crop was $20,488, an average of $39.25 for each farm reporting. The average area for each farm reporting was about one-half acre. The average yield per acre in 1899 was 371 pounds, against 430 pounds in 1889 and 221 pounds in 1879. The average value was 20 cents per pound.

Tobacco was grown in 1899 in 30 parishes of the state. The leading parish was St. James, which furnished 53.5 per cent of the entire area and 52.6 per cent of the entire production of the state.

PEANUTS.

Peanuts were grown in 1899 by 2,467 farmers who devoted to their cultivation 3,107 acres and secured therefrom a product of 45,713 bushels, an average of 14.7 bushels per acre. The acreage has increased approximately fourteenfold, and the production eightfold, since 1889. Of the total acreage, 78.3 per cent was reported from 12 extreme western and northern parishes. The parishes of Calcasieu, Claiborne, De Soto, Union, Lincoln, and Jackson, ranking in the order named, report the largest areas.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 356 acres, and the value of the products sold therefrom was $76,628. These flowers and plants were grown by 74 farmers and florists, of whom 40 made commercial floriculture their principal business. They had invested in the aggregate $150,720, of which $108,675 represents the value of land and improvements other than buildings, $35,575 that of buildings, $5,140 that of implements and machinery, and $1,330 that of live stock. The value of their products in 1899 was $76,510, of which $70,310 represents the value of flowers and plants, $80 the value of products fed to live stock, and $6,120 the value of other products. The expenditure for labor was $12,030, and for fertilizers $800. The average income per farm of all products was $1,913.

In addition to the 40 principal florists' establishments, 48 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 151,962 square feet, making, with the 43,357 square feet belonging to the florists' establishments, a total of 195,320 square feet.

NURSERIES.

The total value of nursery stock sold in 1899 was $63,593, reported by the operators of 43 farms and nurseries. Of this number, 15 derived their principal income from the nursery business. They had 2,104 acres of land, valued at $65,000; buildings worth $22,200; implements and machinery, $4,020; and live stock, $3,610. Their total income was $65,668, of which $57,508 represents the value of nursery stock; $1,310 the value of products fed to live stock; and $6,850, the value of other products. They expended $10,770 for labor and $815 for fertilizers. The average gross income for each farm reporting was $4,378, and the average income per acre, exclusive of the products fed to live stock, was $30.59.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $10,692,710, an average of $92 per farm. The average was $1,791 for sugar farms, $718 for nurseries, $368 for rice farms, $301 for florists' establishments, $76 for hay and grain farms, $68 for dairy farms, $62 for vegetable farms, $59 for fruit farms, $34 for tobacco farms, $26 for live-stock farms, and $19 for cotton farms. "Managers" expended on an average, $3,677; "owners," $104; "cash tenants," $38; and "share tenants," $17. White farmers expended $174 per farm, and colored farmers, $11.

Fertilizers purchased in 1899 cost $1,076,890, an average of $9 per farm, and an increase since 1890 of 18.8 per cent. The average expenditure was $183 for sugar farms, $54 for nurseries, $22 for fruit farms, $20 for florists' establishments, $9 each for hay and grain, and vegetable farms, $6 for tobacco farms, $5 for dairy farms, $3 for live-stock farms, and $2 for cotton farms.

IRRIGATION STATISTICS.

During the periods preceding the census year of 1890 and continuing up to 1894–5, the areas in rice were mainly on the lowlands along the lower Mississippi River and its outlying bayous. Being comparatively level and low, with a slope from the streams, these lands are subject to overflow unless protected by dikes to confine the river to its channel. Drainage is as essential as irrigation and the ditches are made to serve the double purpose of carrying water upon the land for irrigation and drawing it off when the crop is ready for harvest.

The water supply for the lowlands is obtained in various ways, the most common being by means of a flume, or "dahl," in the river levee, constructed on much the same principle as the trunk which is used in the Carolinas in irrigating plantations on tidal streams. The "dahl" was formerly made of sound 3-inch cypress plank of one length. This was supported by three brick walls built so as to extend some distance below the top of the woodwork to keep out crawfish and muskrats, which would otherwise work along the flume and create openings in the levee. The present flumes, under the requirements of a state law, are made of iron without brick supports or mortar protection and are not as substantial or satisfactory in all cases as those of cypress.

The land cultivated in many of the plantations was formerly planted to sugar cane. As it lies below the surface of the river, siphons are replacing the flumes and take the water from the river over the levees. The siphon is usually made of boiler iron, heavy enough to be calked the same as a steam boiler. Powerful steam pumps, taking the water from the river and bayous, are used on several of the large plantations.

Another method of irrigation is by the use of tiles, which are placed at a certain distance below the surface. By stopping these at the lower end of the field, the water is forced up through a layer of earth until irrigation is no longer required, when the plugs are withdrawn and the water passes off the land through the tiles. This system is especially advantageous in a season of excessive rainfall. All of these methods are expensive and failures are numerous owing to inadequate drainage, breaks in the levees, and frequent floods.

The discovery, a few years ago, that a vast area in the southwestern part of the state is admirably adapted to the cultivation of this cereal, revolutionized the growing of rice in this country and placed Louisiana far in the lead among the rice-producing states. This rice belt, extending north from the Gulf for a distance of 20 to 90 miles, is an undulating, gently sloping prairie, having ten navigable rivers and numerous lakes and bayous, and comprising over 12,000 square miles in Louisiana and Texas. At first the rice was cultivated in an exceedingly primitive way, the land being laid off in blocks and squares and irrigated with rain water collected and stored for use when needed. The success of this method, while not extraordinary, attracted many farmers and the country began to develop rapidly. It was found that "Providence" rice, as all rice grown by the aid of rain water is called, was not always a profitable crop. Experiments proved the value of abundant irrigation and quickly demonstrated that the prairie soil, when sufficiently watered, was unequaled for rice growing. This marked the beginning of the real development of this industry, which has made wonderful progress in the three years preceding the census. In 1899 the acreage in rice in southwest Louisiana was more than 77 per cent of that of the state.

Rice irrigation on the prairies is comparatively simple. Throughout the region are numerous ridges slightly higher than the rest of the land. It is upon these ridges that the canals are built, varying in width from 20 to 100 feet. Branching from the main canals are the laterals which run to outlying farms. The pumping plants at the head of the canals lift the water from the streams, whence it is carried in the main canal to the point of diversion on the land. More than one pumping plant is required on some of the large canals, owing to the necessity of several lifts to get the water into the canal.

The land to be planted in rice is usually broken and leveled in December and January, levees turned up around the fields, and cross levees put in, the levee work being accomplished by means of a large plow made for the purpose. Rice may be planted any time from February to June. One and one-fourth bushels of seed are used per acre, being sown broadcast or drilled, as preferred. When the rice reaches a height of from 6 to 8 inches, the water is turned on the land to a depth of 2 to 10 inches to secure the best results. Stooling begins when the rice is about 11 inches high. The water is kept on the land until the heads are filled, when the levees are cut and the water turned off to permit the rice to ripen and the ground to become dry enough for the harvester. Herein the prairie region possesses a distinct advantage over the delta lands. In the former the crop is harvested the same as wheat in the Northwest, while in the latter, owing to the moist soil, harvesting must be done with the sickle and requires many laborers and much time.

The numerous pumping plants, drawing millions of gallons daily from the streams and bayous, in many places have lowered the water levels, and some alarm was occasioned as to the future of the water supply. It was then ascertained that this region is underlaid with inexhaustible beds of water-bearing gravel, and flowing wells or wells with pressure sufficient to bring the water nearly to the surface are employed in large numbers to augment the supply. Many of these are of sufficient capacity to supply water to 100 acres of rice without diminution in their flow. A well and pumping outfit sufficient to irrigate 200 acres cost from $1,500 to $2,000. It is estimated that not less than 25,000 acres were irrigated in 1899 from wells.

The following table gives, by parishes, the number, length, and cost of the principal canals and ditches, and the acreage irrigated in 1899.

Table A.—RICE IRRIGATION STATISTICS, 1899.

PARISHES.	NUMBER OF IRRIGATION SYSTEMS— Supplied with water from— Streams.	Wells.	Total.	ACREAGE IRRIGATED— From streams.	From wells.	Total.	COST OF IRRIGATION SYSTEMS— Supplied with water from— Streams.	Wells.	Total.	Average per acre irrigated, 1899.	Total length of main ditches, in miles.
The State	542	54	596	194,788	6,897	201,685	$2,475,964	$53,355	$2,529,319	$12.54	386
Acadia	21	7	28	67,305	650	67,955	1,074,200	3,225	1,077,425	15.85	132
Calcasieu	29	26	55	40,731	3,590	44,321	836,000	26,820	862,820	19.47	159

Vermilion	9	7	16	24,025	885	24,910	232,200	9,350	241,550	9.70	42
All other parishes	83	12	95	41,981	1,423	43,404	89,829	11,260	101,089	2.33	23

[1] Siphon irrigation; no large ditches used except for drainage.

Irrigation of vegetables was reported on 6 farms having a total irrigated area of 48 acres. Wells supplied water for 24 acres, 8 acres were irrigated from streams by means of gravity diversion ditches, and 16 acres from streams by means of siphons. The total cost of construction of these systems was $755, or an average cost of $23.44 per acre.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 228. WASHINGTON, D. C. July 3, 1902.

MANUFACTURES.

GLASS MANUFACTURE.

Hon. WILLIAM R. MERRIAM,

Director of the Census.

SIR: I transmit herewith, for publication in bulletin form, a report on glass manufacture, prepared under my direction by Mr. Shirley P. Austin, of Pittsburg, Pa., acting in the capacity of an expert special agent of the division of manufactures of the Census Office.

The statistics of glass manufacture were reported in 1880 and 1890 under four subdivisions, that is: Plate glass, window glass, glassware, and green and black glass. A separate schedule was prepared for each subdivision. In 1900 it was decided to assign the reports for the industry to two classes of products: Building glass, including plate glass, all varieties of cast and rolled sheet glass, and window glass; and pressed and blown ware and bottles and jars, including all pressed or blown flint glassware, and bottles and jars of flint, green, or amber glass.

The statistics seem to show a satisfactory rate of growth in the several branches of the industry, notwithstanding the fact that in nearly all lines the domestic manufacturers have been compelled to meet a vigorous foreign competition. The development of the industry has been marked by a noteworthy increase in the use of tank furnaces, and mechanical processes in lieu of hand work, which have resulted in an increased output combined with greater economy of operation. The distribution of the factories has depended to a considerable extent upon the supply of natural gas, the discovery of new fields being marked by an influx of glass factories from other localities having less favorable advantages in respect to fuel.

The statistics are presented in 14 tables: Table 1, comparative figures for the industry at the several censuses; Table 2, the statistics for idle establishments; Table 3, value of new construction; Tables 4 and 5, comparative statistics, by states, and by classes of products, respectively, 1880 to 1900; Table 6, rank of states according to value of products, with per cent of total value, 1880 to 1900; Tables 7 and 8, comparative statistics of the manufacture of building glass and the manufacture of pressed and blown glass and bottles and jars, respectively, by states, 1890 and 1900; Table 9, number of bottles manufactured, classified by capacity, by states; Table 10, imports and exports of glass; Table 11, comparative summary of materials used, 1890 and 1900; Tables 12, 13, and 14, presenting detailed statistics of the combined industry, the manufacture of building glass, and the manufacture of pressed and blown glass and bottles and jars, respectively.

In drafting the schedules of inquiry for the census of 1900, care was taken to preserve the basis of comparison with prior censuses. Comparison may be made safely with respect to all the general heads of the inquiry except those relating to capital, salaried officials, clerks, etc., and their salaries, the average number of employees, and the total amount of wages paid. Live capital, that is, cash on hand, bills receivable, unsettled ledger accounts, raw materials, stock in process of manufacture, finished products on hand, and other sundries, was first called for at the census of 1890. No definite attempt was made, prior to the census of 1890, to secure a return of live capital invested.

Changes were made in the inquiries relating to employees and wages, in order to eliminate defects found to exist on the form of inquiry adopted in 1890. At the census of 1890 the average number of persons employed during the entire year was called for, and also the average number employed at stated weekly rates of pay, and the average number was computed for the actual time the establishments were reported as being in operation. At the census of 1900 the greatest and least number of employees were reported, and also the average number employed during each month of the year. The average number of wage-earners (men, women, and children) employed during the entire year was ascertained by using 12, the number of calendar months, as a divisor into the total of the average numbers reported for each month. This difference in the method of ascertaining the average number of wage-earners during the entire year may have resulted in a variation in the number, and should be considered in making comparisons.

At the census of 1890 the number and salaries of proprietors and firm members actively engaged in the business or in supervision were reported, combined with clerks and other officials. In cases where proprietors and firm members were reported without salaries, the amount that would ordinarily be paid for similar services was estimated. At the census of 1900 only the number of proprietors and firm members actively engaged in the industry or in supervision was ascertained, and no salaries were reported for this class. It is therefore impossible to compare the number and salaries of salaried officials of any character for the two censuses.

Furthermore, the schedules for 1890 included in the wage-earning class overseers, foremen, and superintendents (not general superintendents or managers), while the census of 1900 separates from the wage-earning class such salaried employees as general superintendents, clerks, and salesmen. It is possible and probable that this change in the form of the question has resulted in eliminating from the wage-earners, as reported by the present census, many high-salaried employees included in that group for the census of 1890. With the exception of several other changes in the special features of the schedule, the investigation has been conducted along the lines followed at the census of 1890.

In some instances the number of proprietors and firm members, shown in the accompanying tables, falls short of the number of establishments reported. This is accounted for by the fact that no proprietors or firm members are reported for corporations. The reports show a capital of $61,423,903 invested in the 355 establishments reporting for the industry. This sum represents the value of land, buildings, machinery, tools, and implements, and the live capital utilized, but does not include the capital stock of any of the corporations. The value of the products is returned at $56,539,712, to produce which involved an outlay of $2,792,376 for salaries of officials, clerks, etc.; $27,084,710 for wages; $3,588,641 for miscellaneous expenses, including rent, taxes, etc.; and $16,731,009 for materials used, mill supplies, freight, and fuel. It is not to be assumed, however, that the difference between the aggregate of these sums and the value of the products, is, in any sense, indicative of the profits in the manufacture of the products during the census year. The census schedule takes no cognizance of the cost of selling manufactured articles, or of interest on capital invested, or of the mercantile losses incurred in the business, or of depreciation in plant. The value of the product given is the value as obtained or fixed at the factory. This statement is necessary in order to avoid erroneous conclusions from the figures presented.

Very respectfully,

S. N. D. North

Chief Statistician for Manufactures

GLASS MANUFACTURE.

By Shirley P. Austin, *Expert Special Agent.*

The manufacture of glass in this country dates almost from the arrival of the first English colonists in what is now the United States. One of the earliest attempts, if not the first, at manufacturing in the original thirteen colonies was directed toward the production of glass, and a glass works erected for that purpose in 1608 or 1609, and located about a mile from Jamestown, Va., was probably the first manufactory erected in America by the English colonists. In 1608 the London Company sent glassworkers to America to operate the plant, and in the following year some of the products constituted a part of the first cargo of goods exported from this country.[1] This first glass factory probably produced bottles exclusively. Its career was brief, as in 1617 it was reported fallen into decay, and later was swept entirely away in the Indian massacre of 1622. In 1620 a subscription list was started in Jamestown to erect a factory for the manufacture of glass beads, the currency among the Indians, and in 1621 the London Company sent Italian workmen for this plant, which seems to have been located some distance from Jamestown, as it escaped the massacre of 1622, and is referred to as late as 1623. In 1639 a glass factory was located at Salem, Mass., and previous to this, although the exact date is not known, glass was first made in New York on Manhattan Island.[2] The first mention of a glass factory in Pennsylvania is contained in a very vague reference in a letter written by William Penn in 1683. The progress of the industry during the colonial period was slow and financial reverses were the rule. The scarcity of glass during the Revolutionary War stimulated factory erection, and early in the Nineteenth century the industry assumed much prominence, being confined largely to Massachusetts, New York, eastern Pennsylvania, New Jersey, and Maryland. These early factories were usually situated within easy access to forests, from which the fuel supply was obtained. Not until the erection of the first factory west of the Allegheny Mountains, at Pittsburg in 1797, was coal used as a fuel in glass manufacture, and it was many years before it came into general use.[3] The Atlantic seaboard long held supremacy in the manufacture of glass, but with the westward spread of population and the discovery of rich fuel resources in western Pennsylvania, West Virginia, Ohio, and Indiana, the center of the industry has steadily moved westward and the bulk of the production has been for some time west of the Alleghenies.

This report, with the statistical tables accompanying it, includes only establishments manufacturing glass from the crude material and does not include the large number of separate establishments engaged in the reworking of glass, such as silvering, beveling, cutting, engraving, decorating, etc. A number of the glass establishments, however, carry on these processes in direct connection with the manufacture of the "metal" in the same factory, and such establishments are included.

The inquiry into glass manufacture for this census was based on the following classification of the industry: (1) Building glass, all establishments making common window glass, plate glass, and all varieties of cast and rolled sheet glass; (2) pressed and blown glass, all establishments manufacturing pressed or blown flint glassware, tableware, jellies, tumblers, goblets, lamps, chimneys, lantern globes, gas and electric lighting ware, stem ware, opal ware, cut glass, etc.; (3) bottles and jars, all establishments manufacturing bottles and jars in flint, green, or amber glass. It has been found necessary to combine the last two divisions, as several firms reported production in both these branches.

Table 1 is a comparative summary of the statistics for the industry as returned at the censuses of 1850 to 1900, inclusive, with the percentages of increase for each decade.

[1] Decrease. [2] Includes proprietors and firm members, with their salaries; number only reported in 1900, but not included in this table. (See Table 12.)
[3] Not reported separately. [4] Not reported.

The remarkable growth of the glass making industry in the last half century is shown in Table 1. With the exception of a decrease in the number of establishments between 1870 and 1880, the table shows a steady increase in every item from 1850 to 1900. From 1850 to 1900 the number of establishments increased 261, or 277.7 per cent. The great improvement in factory construction and equipment and the broadening of the scope of the business during the same period are indicated by the increase in capital from $3,402,350 in 1850 to $61,423,903 in 1900, or 1,705.3 per cent. The number of wage-earners has increased from 5,668 in 1850 to 52,818 in 1900, or 831.9 per cent; and wages paid, from $2,094,576 in 1850 to $27,084,710 in 1900, or 1,193.1 per cent. During the same period the cost of materials used has increased from $1,556,833 to $16,731,009, or 974.7 per cent; and the value of products, from $4,641,676 to $56,539,712, or 1,118.1 per cent.

The growth from 1890 to 1900 was vigorous, as shown by an increase of 20.7 per cent in number of active establishments, and of 49.9 per cent in capital invested. The increase in capital was largely caused by the general introduction during the decade of the tank melting furnace, which necessitates much more costly and permanent factory construction and equipment than the pot furnace, which it is fast supplanting.

Of the total cost of materials used in 1900, $16,731,009, the principal item was the cost of packages and package materials, which was $3,390,627, and in 1890 was $1,853,462, an increase of $1,537,165, or 82.9 per cent. This large increase was caused in part by the demand for a neater package for finished products in nearly all lines of glass manufacture, created by increased competition, and by the more general use of the carton package for lamp chimneys, shades, globes, and the great variety of high-grade glassware, and the increased use of paper between sheets in packing building glass. In addition to the above package materials, establishments manufacturing pressed and blown ware, bottles, and jars reported in 1900, $1,522,917 as the cost of caps, metal trimmings, and rubber supplies. The cost of these materials was not reported separately at the census of 1890, but there has been an enormous increase in their consumption.

The total cost of fuel in 1900 was reported as $3,203,146. Of this amount, natural gas cost $1,575,278; coal, $1,074,074; and oil, $409,158; the remainder being divided between coke and wood. A number of establishments, particularly in Indiana, reported little or no cost for fuel, as they were either getting "free gas" as an inducement for location, or owned the source of their supply, and reported the small cost of maintenance under the item of general expense. Hence there was a large amount of natural gas used as fuel which was not reported.

Soda ash is the third largest item of cost in materials used, 157,779 tons being reported, at a cost of $2,259,939. In 1890, 96,777 tons were reported, costing $3,108,233. The average cost per ton in 1900 was $14.32, and in 1890, $32.12. While the quantity of soda ash used in glass manufacture during the decade increased 63 per cent, the cost decreased 27.3 per cent. The comparison shows the benefits derived by the glass industry from the development of the American soda-ash manufacture in the last ten years, a development that received the greater share of its impetus from men actively connected with the glass industry.

The increase in the value of products between 1890 and 1900 was 37.7 per cent, but it is safe to say the increase in the quantity of products was in excess of that, especially in the output of bottles, jars, and glassware, owing to the general introduction of the tank melting furnace and the adoption of improved mechanical equipment. The number of pieces of glassware, bottles, jars, etc., manufactured, was not reported at the census of 1890. It is therefore impossible to make a comparison with such data at the present census. The total production of plate glass, rough and polished, in 1890, was 12,206,942 square feet; and in 1900, 17,512,262 square feet, an increase of 43.5 per cent. There were 2,773,824 square feet of cathedral glass manufactured in 1890, and 8,846,361 square feet in 1900, or an increase of 218.9 per cent. The quantities of skylight and wire glass manufactured in 1900 were 3,679,694, and 1,295,504 square feet, respectively. No report was made of these products at the census of 1890. In 1890 there were 3,768,884 boxes of window glass manufactured, and 4,341,282 boxes in 1900, an increase of only 15.2 per cent. The comparatively small increase is explained by the much shorter "run" of factories during the "fire" covered by the present census, the average "run" being about six months in 1900 and nearly ten months in 1890. In addition, a large percentage of the available capacity of the factories was idle in 1900 for want of workmen.

Table 2 shows the idle establishments, by states, with the capital invested and the equipment of the factories, for 1900.

TABLE 2.—IDLE ESTABLISHMENTS, BY STATES: 1900.

Grinding machines for fruit-jar tops, number	4		1					3		

In addition to the 355 active establishments reported in 1900, Table 2 shows that 60 establishments, with a capital of $3,544,536, were reported as idle during the census year. These establishments were located as follows, by states: Illinois, 6; Indiana, 7; Kentucky, 2; New Jersey, 8; New York, 4; Ohio, 8; Pennsylvania, 19; Washington, 1; West Virginia, 5. Only those idle establishments that seemed reasonably certain of being again put in operation in the near future are included in Table 2. No account was taken of the many dismantled and abandoned glass factories in the country.

Of the 60 idle establishments reported, 41, with a capital of $2,296,587, were for the manufacture of pressed and blown ware or bottles and jars. The equipment of these establishments was as follows: 22 furnaces of 257 pots; 19 continuous tanks of 152 rings, or 304 pots capacity; 11 intermittent or day tanks of 120 pots capacity; 118 glory holes; 61 annealing ovens; 117 lehrs; 11 decorating kilns; 2 decorating lehrs; 56 hand presses; 12 mechanical presses; 10 blowing machines; 15 finishing machines; 16 crimping machines; 3 sand-blast machines; and 4 machines for grinding fruit jar tops. The remaining 19 idle establishments were building-glass factories, which reported a total capital of $1,247,949, and the following equipment: 19 furnaces of 231 pots; 8 continuous tanks of 96 rings or 288 pots capacity; 5 day tanks of 19 pots capacity; 38 flattening ovens; 32 monkey ovens; 20 blow furnaces; 6 casting tables; 6 annealing ovens; 3 bending ovens; 36 lehrs; 13 grinding machines; 3 polishing machines; and 2 clay grinding mills.

In addition to the establishments that were idle throughout the census year, a certain portion of the furnace equipment of active establishments was reported as idle. In active building glass factories, 29 pot furnaces with 471 pots, and one intermittent or day tank furnace of 7 pots capacity were reported as idle. In active pressed and blown ware and bottle and jar factories, 31 pot furnaces with 336 pots, 14 continuous tank furnaces with 79 rings of 158 pots capacity, and 16 intermittent or day tank furnaces of 76 pots capacity were reported as idle. The entire idle furnace equipment of active establishments in both branches of glass manufacture was as follows: 60 pot furnaces with 807 pots, 14 continuous tank furnaces with 79 rings of 158 pots capacity, and 17 intermittent or day tank furnaces of 83 pots capacity. It should be stated in this connection that this idle equipment is included in all tables presenting such data in this report, except Table 2. Adding the statistics of active establishments to those shown in Table 2 gives a total of 415 active and idle establishments in the United States, with a capital of

$64,968,439. The combined equipment of all establishments is as follows: Furnaces, 492; pots, 5,595; continuous tanks, 233; pot capacity of continuous tanks, 4,525; intermittent or day tanks, 163; pot capacity of intermittent or day tanks, 1,040; flattening ovens, 323; monkey ovens, 34; blow furnaces, 279; casting tables, 106; annealing ovens, 936; bending ovens, 12; clay grinding mills, 73; grinding machines, 240; polishing machines, 297; shops, 4,145; glory holes, 1,537; lehrs, 1,480; decorating kilns, 116; decorating lehrs, 25; hand presses, 971; mechanical presses, 61; blowing machines, 179; finishing machines, 155; crimping machines, 510; mechanical polishers, 16; sand-blast machines, 76; grinding machines for fruit jar tops, 141.

Table 3 presents the value of new construction, by states, during the census year. Only the value of additions to existing factories is given in the table, not including ordinary repairs and the value of new plants constructed.

TABLE 3.—NEW CONSTRUCTION, BY STATES: 1900.

STATES.	Cost of new construction (additions to old works, not including ordinary repairs) during census year.
United States	$578,917
Georgia	2,500
Illinois	43,448
Indiana	186,004
Michigan	4,848
New Jersey	22,664
New York	37,429
Ohio	26,141
Pennsylvania	184,682
West Virginia	12,201
Wisconsin	59,000

Table 4 presents comparative statistics of glass manufacture, by states, for the years 1880, 1890, and 1900.

TABLE 4.—COMPARATIVE STATISTICS, BY STATES: 1880 TO 1900.

STATES.	Year.	Number of establishments.	Capital.	Salaried officials, clerks, etc.: Number.	Salaried officials, clerks, etc.: Salaries.	Total: Average number.	Total: Wages. 1 Not reported in 1880.

2 Includes establishments distributed as follows: 1900—California, 1; Colorado, 1; Delaware, 1; Georgia, 1; Michigan, 1; Virginia, 2; Wisconsin, 1. 1890—California, 1; Colorado, 1; Delaware, 1; Georgia, 2; Kentucky, 2; Michigan, 1; Wisconsin, 1. 1880—California, 1; Connecticut, 1; Iowa, 1; Michigan, 1; New Hampshire, 1.

3 While the aggregate value for the respective states is the aggregate value of products reported for all branches of glass manufacture, this total can not be obtained by adding the amounts given, as the reports of certain products have been suppressed, to avoid disclosing the operations of individual establishments.

4 No establishments reported.

5 Included in "all other states."

[1] The equipment of glass manufacturing plants, other than furnaces and pots, not having been reported by state totals in 1880, the comparison can be made only for the United States for that year.
[2] Not reported in 1880 and 1890.
[3] No establishments reported.
[4] Included in "all other states."
[5] Includes establishments distributed as follows: 1900—California, 1; Colorado, 1; Delaware, 1; Georgia, 1; Michigan, 1; Virginia, 2; Wisconsin, 1. 1890—California, 1; Colorado. 1; Delaware, 1; Georgia, 2; Kentucky, 2; Michigan, 1; Wisconsin, 1. 1880—California, 1; Connecticut, 1; Iowa, 1; Michigan, 1; New Hampshire, 1.

[1] Not reported.

Tables 4 and 5 show large increases in the number of salaried officials and their salaries, between 1890 and 1900, caused by the organization of large consolidations in the glass business within the last five years. The most interesting disclosure, however, is the widespread substitution of the tank for the pot furnace for melting glass. No statistics of tank furnaces appear in the report on glass manufacture at the census of 1890, although a number were in existence at that time. These tanks were then largely regarded as in the experimental stage, although it had been demonstrated in 1888 that their operation was a success, particularly in the manufacture of window glass. It was several years before glass manufacturers were convinced of the advantages of the tank over the pot furnace; but from 1890 on, the introduction of the tank has been steady and is the prominent feature of the progress of the American glass industry during the last decade. A larger production and a more uniform quality of glass are rendered possible by the use of the tank system of melting than by the pot-furnace system, especially in the manufacture of window glass and bottles and jars. Although the cost of the installation of the tank system is considerably greater than that of the pot system, the former is much more economical and regular in operation. In many departments of the glass industry it meets the demand for more glass for less money. The introduction of the continuous tank in the manufacture of bottles and jars has been fully as general as in the manufacture of window glass, and continuous and intermittent or day tanks are being more and more extensively used in the manufacture of common tumblers and jellies, opal ware, lantern globes, lamp founts, chimneys, shades, and globes, and novelties and specialties in pressed and blown ware.

The statistics of furnaces are of little value for comparative purposes, owing to the general introduction of the tank furnace during the last decade. The following comparisons have been made on the assumption that all furnaces reported in 1890 were pot furnaces; this is not strictly correct, as it is known that there were several tank furnaces in operation at that time, but they were not shown separately in the published statistics. The number of tank furnaces reported was small, however, and would not materially affect the comparisons.

Since 1890 there has been a decrease of 20 per cent in the total number of pot furnaces, 564 being reported in 1890 and 451 in 1900. In building glass, 195 pot furnaces were reported in 1890 and 193 in 1900, a decrease of only 2, while the decrease in the number of pot furnaces for pressed and blown glass and bottles and jars was 111, or 30.1 per cent, 369 being reported in 1890 and 258 in 1900. However, in 1900 there is a total increase for the United States of 353 tanks—206 continuous and 147 day—making a gain in the total number of melting furnaces in 1900 over 1890 of 240, or 42.6 per cent. In building glass, 34 continuous and 14 day tanks were reported in 1900, making an increase in the total number of furnaces for that class in 1900 of 23.6 per cent over the number reported in 1890. In the class of pressed and blown ware and bottles and jars, 172 continuous and 133 day tanks were reported in 1900, making a gain of 52.6 per cent in the total number of furnaces in that division in 1900 over the total for 1890.

By estimating the ring capacity of the continuous tank in building glass establishments as equal to 3 pots, and in pressed and blown glass and bottle and jar establishments as equal to 2 pots, and estimating the ton capacity of the day tank in both classes as equal to a like pot capacity, the 353 tanks have a total capacity of 4,834 pots, 1,430 of which are in building glass factories and 3,404 in pressed and blown glass and bottle and jar factories. A comparison of the capacity of the pot furnaces reported in 1900 with the capacity reported in 1890, shows an increase in capacity of 3.5 per cent; an increase in building glass capacity of 13.4 per cent; and a decrease in pressed and blown ware and bottle and jar capacity of 3.3 per cent. However, the total capacity of both pot furnaces and tanks for the entire industry in 1900 increased 101.6 per cent over 1890; of building glass capacity, 84.1 per cent; and of pressed and blown ware and bottles and jars, 113.7 per cent. The increase of only 23.6 per cent in the number of furnaces in building glass factories, with an increase of 84.1 per cent in the pot capacity, indicates the much larger capacity of the average window tank than that of the tank used in the production of pressed and blown ware and bottles and jars, where the number of furnaces increased 52.6 per cent and the pot capacity increased 113.7 per cent. The day tank in building glass factories is used in the manufacture of skylight, tile glass, etc.

The general introduction of the tank for glass melting has created, within the past decade, a separate industry of considerable magnitude—the preparation of the clay for the construction of tanks. At the same time the manufacture of the glass melting pot has been transferred largely from the glass factory to a few establishments that make a specialty of its manufacture.

Table 6 presents the rank of states in glass manufacture as a whole from 1880 to 1890, according to value of products, with the percentages of total value of products for the United States.

TABLE 6.—RANK OF STATES ACCORDING TO VALUE OF PRODUCTS: 1880 TO 1900, WITH PER CENT OF TOTAL VALUE.

All other states[4]				924,706	1,065,397		1.6	2.6	

[1] Included in "all other states."
[2] Not reported.
[3] Less than one-tenth of 1 per cent.
[4] Includes the following states: 1890—California, Colorado, Delaware, Georgia, Kentucky, Michigan, Wisconsin; 1900—California, Colorado, Delaware, Georgia, Michigan, Virginia, Wisconsin.

Glass manufacture was reported in 17 states in 1900; in 17, in 1890; and in 16, in 1880. Wisconsin, Virginia, Delaware, Georgia, and Colorado were not reported in 1880. Iowa, New Hampshire, and Connecticut dropped out of the producing column in 1890, but Wisconsin, Delaware, Georgia, and Colorado were added. In 1900, Virginia, the home of the first glass factory, was again reported. No reports of glass manufacture were made from Kentucky in 1900. Since 1900 glass factories have been projected in Washington, Kansas, Tennessee, and South Carolina.

Pennsylvania has occupied first place as a glass-producing state for the last three decades. The discovery of gas in Indiana attracted many factories early in the last decade, especially from Ohio, where the gas was practically exhausted for factory purposes after a few years' existence. As a result, in 1900 Indiana has changed places with Ohio as a glass-producing state, the value of its product in 1900 being nearly five times that of 1890. New Jersey, the third state in 1900 and 1890, and the second in 1880, has held its prominent position by virtue of good sand deposits and advantageous geographical position, and largely from the fact that there are numerous native glass workers in the state not at all inclined to leave, even when better positions are offered elsewhere. There are indications, however, that this reserve on the part of the New Jersey workman is disappearing, and it is a question if the state will continue to hold its present position. West Virginia, which was ninth in glass manufacture in 1890, was seventh in the value of its glass products in 1900, increasing nearly 100 per cent during the decade. The excellent fuel resources of this state, in view of the rapid decline of the gas fields of Indiana, have recently greatly stimulated the growth of its glass manufacture, and will no doubt have the effect of placing it among the leading states in the industry.

The direction of the growth of the industry has always closely followed the fuel supply. The evident failing of the gas supply in Indiana has fixed attention on the gas field of southeastern Kansas, and it is probable that in a short time the industry will be established in that section, although unfavorable freight rates and the refusal of the citizens to hold out tempting cash bonuses for the location of factories have so far kept the glass factory out of that field. Some establishments now in Indiana are likely to be soon moved to the gas fields of West Virginia or western Pennsylvania, and some have already been transferred into the coal fields of Indiana and Illinois and will operate with gas produced from the coal of these states. The largest factories in the Indiana gas field are likely to be soon equipped to operate with gas produced from coal, which will give the glass industry of the state a permanency always lacking when cheap natural gas is the fuel used. During the present decade, owing to the absence of a great cheap fuel supply and the steady adoption of the producer gas-fuel system, many factories will be located at new points within convenient access to the great glass consuming sections, particularly in the West. The Pacific coast is attracting more and more attention as a field for glass manufacture, and the cheap fuel oil of southern California, coupled with the growing demand for a glass package from the fruit packers, will probably lead to a decided increase in the glass production of that state within a very short time.

BUILDING GLASS.

Table 7 presents comparative statistics, by states, for the building glass industry, for 1890 and 1900.

[1] While the total value for the respective states is the total value of products reported for all classes of the building glass manufacture, this total can not be obtained by adding the amounts given, as the reports of certain products have been suppressed to avoid disclosing the operations of individual establishments.
[2] Includes 4,338,743 square feet of skylight, ribbed glass, opalescent glass, etc.
[3] Included in "all other states."
[4] Includes establishments distributed as follows: 1900—Illinois, 1; Maryland, 2; Massachusetts, 1; Missouri, 2; West Virginia, 2; and Delaware, 1. 1890—Plate glass: Illinois, 2; Missouri, 2; New York, 1; and Ohio, 1. 1890—Window glass: Delaware, 1; Illinois, 3; Maryland, 4; Massachusetts, 1; Michigan, 1; Missouri, 1; New York, 8; and Ohio, 21.
[5] Not reported in 1890.

Of the 124 establishments reporting for 1900, 13 manufacture polished plate glass, 9 of which also make skylight; 11, rough, rolled, or ribbed glass, cathedral, wire, or skylight glass, or glass tiling and no plate glass; and 100, window glass.

Plate Glass.—The plate-glass establishments are located as follows, by states: 8 in Pennsylvania; 3 in Indiana; and 1 each in Missouri and Ohio. The total capacity of these plants is 53 furnaces with 1,100 pots, having an estimated capacity of 31,866,000 square feet a year. However, only 696 pots were active during the census year, casting 21,172,129 square feet of glass, 16,883,578 square feet of which were polished, and 628,684 square feet sold as rough glass. In 1900, 85.5 per cent more polished plate glass was made than in 1890, while the prices at which it sold were 33.3 per cent under those of 1890. In 1876, three years after the first substantial success in the manufacture of polished plate glass in the United States, the domestic production was about 600,000 square feet, and importations for consumption were 4,628,439 square feet, indicating a total plate-glass consumption in the United States of 5,228,439 square feet, against sales of foreign and domestic glass in 1900 of about 18,000,000 square feet, the imports of plate glass for consumption for the year amounting to 1,064,079 square feet.

After abortive attempts to successfully manufacture polished plate glass in this country, at Cheshire, Mass., in 1852–53, and at Lenox Furnace, Mass., in 1855–1871,[1] the first successful production of polished plate glass occurred at the plant at New Albany, Ind., built in 1869 by Capt. J. B. Ford, and operated after 1872 by W. C. DePauw. Not until 1873 did the plant succeed in producing polished plate glass, and Mr. De Pauw stated[2] that not until 1879 was it possible to produce the glass at a profit. This plant was dismantled at some time during the last decade because of unfavorable location and obsolete equipment. The manufacture of polished plate glass was commenced at Crystal City, Mo., in 1875, by the American Plate Glass Company, which company was reorganized the following year by the Hon. E. A. Hitchcock as the Crystal City Plate Glass Company, and has continued in successful operation since, the plant now being owned by the Pittsburg Plate Glass Company, which owned 10 of the 13 establishments reported in 1900. When Captain Ford left New Albany in 1872,[3] he at once located a plant at Louisville, Ky., leaving there in 1875, and starting a plant at Jeffersonville, Ind. These 4 establishments were the ones reported at the census of 1880.

The large profits made by these establishments caused a boom in plate glass factory erection, which was further stimulated by the discovery of gas in Indiana about 1890, the success of natural gas in the manufacture of plate glass having been demonstrated in the factory built by Captain Ford at Creighton, Pa., in 1883. In 1893 Hon. E. A. Hitchcock stated before the Ways and Means Committee of the House of Representatives that there were 12 establishments manufacturing polished plate glass, located at Creighton, Tarentum, Charleroi, Ford City, Butler, Duquesne, and Irwin, in Pennsylvania; New Albany, Elwood, Kokomo, and Alexandria, in Indiana; and Crystal City, Mo. These establishments manufactured plate glass largely in excess of the consumption, and a period of low prices followed, that led, in 1895, to the consolidation of eight establishments under the head of the Pittsburg Plate Glass Company. The outside establishments were the DePauw, at New Albany, Ind.; the American, at Alexandria, Ind.; the Standard Plate Glass Company, at Butler, Pa.; and the Penn Plate Glass Company, at Irwin, Pa. The plant at New Albany was soon abandoned and that at Alexandria was closed, but on the burning of the factory at Irwin about two years ago, the Penn Plate Glass Company secured the factory at Alexandria, Ind., and now operates it as the American Plate Glass Company.

In 1897 the Marsh Plate Glass Company erected a plant at Walton (now Floreffe), Pa., to manufacture thin plate glass under the patents of George Marsh, which substituted a table for holding the plate by a vacuum process in place of plaster of paris, during the grinding and polishing. The Marsh Company claimed to be able to successfully manufacture polished plate glass in all popular glazing sizes as thin as one-sixteenth of an inch, and by their improved table and system of holding the glass, to practically eliminate all breakage. Before this claim was fully demonstrated, the plant was bought by the Pittsburg Plate Glass Company, and has since been used largely as an experimental factory. Experiments in the manufacture of thin plate glass are also being tried at the plant of the Pittsburg Company at Ford City, Pa. The Marsh Company was the first to successfully introduce the continuous lehr for annealing plate glass, a process that promises to soon displace the slower and more expensive annealing kiln system. A factory was erected near Toledo, Ohio, by the Edward Ford Plate Glass Company in 1900, which was in operation only six months during the census year. This factory is equipped with a continuous lehr, and in the extensive use of electricity as motive power is an innovation.

The principal improvement in plate glass manufacture during the last decade was undoubtedly the successful introduction of the annealing lehr, as noted above, at the plant of the Marsh Plate Glass Company, at Walton, Pa. Although its introduction into the older plants has so far been slow, owing to the expense attending the abandonment of the costly kiln system in use at those plants, yet competition will soon have the effect of bringing the lehr into general use. Previous to the introduction of the lehr, the annealing

[1] Tenth Census of the United States, Report on Glass Manufacture; by Joseph D. Weeks, Special Agent, page 98.

[3] Ibid., page 99.

of plate glass was done in practically the same manner as at the commencement of the industry in this country. As soon as the cast is made the plate is introduced into the annealing oven or kiln, a large, shallow, reverberatory furnace of brick, on the smooth floor of which the plate is laid. The kiln being heated to near the melting point and all openings tightly closed, it is allowed to cool gradually to a point where it is opened and the plate removed, the process requiring fully three days.

The plate glass annealing lehr averages about 200 feet in length, and starts from the casting table as a continuous, connected series of five kilns, after which it is the usual rod lehr common in window glass manufacture. The five stations at the start are on a solid hearth of especially prepared clay, giving an absolutely smooth, level bed. The whole interior of the lehr is brilliantly lighted by electricity, and the heat at any point can be controlled with the utmost nicety by the use of pyrometers. After the cast is made the plate is introduced into the first station of the lehr, where the temperature is near the melting point. In due time the plate passes into the second station, where the temperature is lower. So the plate passes through the five stations with a diminishing temperature. When the plate leaves the fifth station, it has become thoroughly "set," and passes to the rod lehr, which carries it along through decreasing temperatures until, three hours after the cast was made, the annealing process is complete, and the plate is taken out of the lehr ready for the grinding process. The time required to anneal a plate under the lehr system, compared with that under the kiln system—three hours as against three days—indicates the revolutionizing possibilities of the lehr, when cost of construction is also taken into consideration. A lehr that will anneal the product of 96 pots, or 96 plates of glass a day, costs about $20,000 to build, and displaces 96 old-style three-plate kilns, which cost about $1,000 each to build. The lehr takes up far less space than does the kiln system, and the building required for the lehr costs about $6,000, as against $30,000 for the construction of the proper building for the 96 kilns it would displace.

With the lehr, smaller pots are used and thinner and smaller plates cast, resulting in a great increase in the average size of the finished plate, as the smaller the original cast, the better are the chances for the plate going through the annealing, grinding, and polishing processes successfully without diminution of size. The lehr-annealed plate, is much straighter than that annealed in the kiln, owing to the solid hearth of the first five stations of the lehr; the floor of the kiln is much more liable to develop inequalities which misshape the plate. The thinness of the lehr-annealed plate means less time spent in grinding, and the smaller size of the rough plate, makes it possible to lay and relay the lehr-annealed plate on the grinding and polishing tables, much quicker, and with less labor, than the kiln-annealed plate.

H. L. Dixon, the well-known glass furnace engineer, asserts that 90 per cent of the polished plate glass manufactured can be annealed in the lehr, the remaining 10 per cent being glass in extremely large sizes, requiring the old style kiln. He is convinced that it is only a question of time until the very largest sizes can be annealed in the lehr. It is claimed that actual practice has shown that the average size of the lehr-annealed glass, cast from small pots, is 90 square feet per plate when squared, while under the kiln system, with large pots and the attempt to continually cast extreme sizes, the average size of the plate taken from the kiln and squared is about 60 square feet, and when finished, about 18 square feet. In addition to the lehr at Floreffe, Pa., the Pittsburg Plate Glass Company reported 3 lehrs at Ford City, Pa., 2 of the 3 being for large sizes and the third for small sizes of about 50 to 60 square feet. The Ford Plate Glass Company, near Toledo, Ohio, report 1 lehr that is said to operate successfully on sizes of 50 to 60 square feet. At Alexandria, Ind., the American Plate Glass Company have a lehr which is said to be working satisfactorily with plates from 75 to 80 square feet.

As is often the case with important inventions, the successful introduction of the lehr in plate glass manufacture came, not from experts, but from novices in the plate glass business, who carried it to success, while the plate glass manufacturers greeted it with derision and declared it impossible. Henry Fleckner, a veteran window glass factory manager of Pittsburg, was the man who first operated the lehr with success at Walton, and the successful operation of the lehrs at Ford City and Toledo, is said to be largely due to Eugene Morenus, a window glass factory manager, and Ralph Gray, a manufacturer of skylight glass.

In addition to the lehr, the Marsh Plate Glass Company at Walton introduced, in the Marsh patent table, the idea of reducing the temperature of the glass while being ground and polished, by the circulation of a constant flow of water under the table. This cooling device, which permits the operation of the grinders and polishers at a much higher speed, has been installed in several foreign factories by Mr. Marsh, and will no doubt soon be put into use in this country. The transfer tables introduced at Ford City, Pa., in the last decade, have added considerably to the rapidity and ease of production, as has also the extended use of electricity as a lifting and motive power. Prior to the adoption of the transfer table, the grinding and polishing tables were stationary, and after one side of the plate had been ground and polished, it was necessary to remove it from its bed of plaster to continue the process. The transfer table is movable from grinder to polisher, thus making it possible to grind and polish one side of a plate without turning it, effecting a great saving in time and decreasing the loss by breakage attending the operation of moving the plate from its bed of plaster of paris.

President John Pitcairn, of the Pittsburg Plate Glass Company, testified[1] before the subcommission of the United States Industrial Commission, at Philadelphia, Pa., December 22, 1900, that since the inception of the plate glass industry in this country, the tendency of prices has been downward, except during 1900, when prices were increased, as a result of an average increase in the cost of raw materials of about 85 per cent, increased cost of manufacture, owing to the diminution of the gas supply, and the substitution of coal, and a better understanding among the manufacturers. He submitted the following table of prices, at periods of five years from 1875 to 1900:

SQUARE FEET.	1875	1880	1885	1890	1895	1900
1 to 3	$0.71	$0.51	$0.46	$0.40	$0.30	$0.31
3 to 5	0.84	0.61	0.55	0.48	0.36	0.38
5 to 10	1.12	0.80	0.72	0.64	0.48	0.60
10 to 25	1.49	1.06	0.96	0.85	0.63	0.81
25 to 50	1.56	1.11	1.01	0.89	0.66	0.85
50 to 100	1.69	1.21	1.09	0.97	0.72	0.90

During 1897, overproduction resulted in a demoralized condition of the industry, and prices were very low. The advance in prices from that time to 1900 was estimated by Mr. Pitcairn to amount to from 50 to 60 per cent. According to the same authority, about two-thirds of the American plate-glass production is sold in sizes under 10 square feet and without profit, a very large part of this two-thirds being sold at a loss. This glass comes into competition with the imported German looking-glass plate, which is blown, ground, and polished, and imported largely into this country to be silvered and used in cheap mirrors. For several years the American plate-glass manufacturers have been meeting this glass, and by a special arrangement with the manufacturers of furniture and mirrors, have succeeded in displacing it with domestic plate glass of a better quality, at prices less than the cost of production. Since 1895 the bulk of the American polished plate glass has been sold direct to the consumer, the Pittsburg Plate Glass Company having established jobbing houses in nearly a score of the large cities, in which branch of the business $4,044,000 was invested in 1900.

For years and with but slight interruptions, the plate-glass manufacturing interests of Europe have been closely allied as to regulation of prices and adjustment of production. As the business of the plate-glass industry in the United States has never been extended beyond the home market, cooperation on that account has not been considered valuable by the European interests; hence, this market has been a "dumping ground" for the surplus European production, and exceptionally low prices have been made on foreign glass for the United States. During the census year prices on stock sizes of European polished plate glass were 36 per cent lower for the United States than for England, while polished plate glass imported into the United States from France, averaged only about 50 per cent of the prices quoted in that country. The fact that the European surplus is placed in this market at a price below average cost, accounts for the heavy importations of polished plate glass. In face of this the domestic production in 1900 increased 85.5 per cent over that of 1890, evincing the steady acquisition of the home market for the domestic product. The production of polished plate glass in Europe in 1900 was given by Mr. Pitcairn in his testimony, in the following table, which shows the regulation of production by giving the productive capacity, and the actual output of the several factories:

NAMES OF COMPANIES.	Producing capacity, square feet.	Actual output, square feet.
Belgium:		
Auvelais	5,000,000	2,500,000
St. Roch	5,000,000	2,600,000
Monstier	3,300,000	1,600,000
Charleroi	2,900,000	1,400,000
Oignies	2,200,000	1,100,000
Courcelles	2,100,000	1,100,000
Roux	1,900,000	1,100,000
Floreffe	1,500,000	700,000
St. Gobain	800,000	400,000
Total, 9 factories	24,700,000	12,400,000
France:

Total, 4 factories	[1] 3,200,000	3,200,000
Italy:		
Pisa (St. Gobain Company)	800,000	800,000
Grand total	68,900,000	39,800,000

[1] Producing capacity of each factory not reported separately.

The average wages paid in plate glass manufacture in the United States, during the year 1900, was estimated by Mr. Pitcairn to be about 200 per cent higher than in England, and about 300 per cent higher than in Belgium. In support of the latter claim he presented the following table, giving a comparison of American and

[1] Report of the Industrial Commission, Vol. XIII, Trusts and Industrial Combinations, pages 225 to 242.

Belgian wages in the plate glass industry in 1900, the Belgian figures being compiled by the European representative of the Pittsburg Plate Glass Company:

	American rate per month, 30 days.	Belgian rate per month, 30 days.	Per cent American higher than Belgian.
Casting department:

About 66 per cent of the wage-earners in the plate-glass industry are native Americans. At the commencement of the industry in the United States it was necessary to get foreign workmen of experience, but the American is so much quicker to learn and is so much more steady, that he is preferred at present.

All of the improvement made in the manufacture of plate glass in this country during the last twenty-five years, aside from some details in the construction of machinery, has been for the purpose of increasing the size of the plates cast and improving the quality of the glass. Until very recently the same methods have been employed for casting, annealing, grinding, and polishing that have been in use for years. The liability of breakage during the finishing process that has attended the attempts to cast extremely large-sized plates, has resulted in a very great reduction in the average size of finished plates. The use of smaller pots, casting smaller and thinner plates for annealing in lehrs, and the adoption of new machinery for grinding and polishing, will undoubtedly result in a considerable decrease in the cost per square foot, and an increase in average size of finished plates, along with a material decrease in undesirable small sizes. A few large pots will be sufficient to supply the demand for extremely large sizes. In the manufacture of plate glass, the use of tank melting furnaces in connection with fining-pot furnaces, is likely to appear in the near future, and the size of the plates cast can then be regulated at will. The possibilities of such a process in connection with the continuous lehr, can scarcely be estimated. The introduction of the continuous lehr, has largely reduced the high ratio formerly existing between cost of construction and capacity of plate-glass factories, and has already resulted in the entrance of 6 new companies, into the field; 4 of the projected factories being in Pennsylvania, and 1 each in Michigan and Illinois.

Cathedral Glass.—There were 8,846,361 square feet of cathedral glass manufactured in 1900, valued at $567,252, compared with 2,773,824 square feet in 1890, valued at $279,407, an increase in quantity of 218.9 per cent, and in value of 103 per cent. The quality of this product has been brought to such perfection, that not only has the domestic market been largely supplied, but a good export trade has been developed with Germany, England, and France. The superiority of colors is increasing the demand for American cathedral or opalescent glass, from the leading foreign art centers. During the census year, 4 establishments in New York, Indiana, and Illinois reported export shipments direct from factories to the value of $13,432.

Wire Glass.—The manufacture of wire glass has been established in the United States on a firm basis during the last decade, and it is probable that this branch of the building glass industry will reach large proportions in the next few years. The quantity manufactured during the census year was 1,295,504 square feet, valued at $129,051. During the year several shipments were made to England, but exact details could not be secured. The industry is yet in its infancy. Wire glass, which is made by casting two sheets of glass with a wire net imbedded between them, has been recognized as a perfect fire retardent, especially adapted for partitions, fire shutters, skylights, and glazing in all places subject to the stress of fire or storm. It is manufactured by 4 establishments, 3 in Pennsylvania and 1 in Missouri.

Skylight Glass, etc.—Although no statistics of skylight glass are shown in the report on glass manufacture at the Eleventh Census, it can be stated that the manufacture of this product has considerably increased, reaching 3,679,694 square feet, valued at $165,086, in 1900.

Nearly all the plate-glass establishments make a specialty of its manufacture and 3 separate establishments produce it almost exclusively. The export trade in this glass is developing in an encouraging manner. The production of bent glass, for store fronts, show cases, etc., is becoming a prominent feature in connection with the production of plate glass, and there are several establishments, in addition, exclusively engaged in this business, which obtain the plate and window glass sheets from the factories and rework them, so are not included in this report. Of the 9 bending ovens included in this report, 5 are in Indiana and 4 in Pennsylvania. Within a few years the manufacture of glass tile has been introduced in this country on an extensive scale. One establishment is making it exclusively, while several others report it as a side line. Its use as a perfect sanitary wall, ceiling, and floor material gives promise of a large growth in this branch of glass manufacture.

Window Glass.—During the last decade a very great improvement has been made in the manufacture of window glass in the United States. This has been brought about by the introduction of the continuous tank furnace for melting the crude materials, in preference to the pot furnace which had been used exclusively since the start of the industry in this country in the early colonial days. Separate statistics of tank furnaces are not shown in the report on glass manufacture at the census of 1890, the tank prior to that date being largely an experiment in this country and in such limited use as to be deemed unworthy of special note at that census. At that time, however, the tank furnace was in successful use in Europe, especially in Belgium. The successful introduction of the tank furnace in the United States occurred at Jeannette, Pa., in 1888, and from 1890 it has been steadily displacing the pot furnace, until in 1900, 54.5 per cent of the capacity of active window-glass factories was contained in tank furnaces. The adoption of the tank has given the window-glass industry a permanency that was lacking when pot furnaces were used exclusively, and when the cost of construction was not great enough to prevent the ready abandonment of a plant for a more avantageous location. While the tank melting system is much more economical than the pot-furnace system, the cost of installation and other factory equipment is much greater. As a result the location of the tank factory is more apt to be selected with respect to permanency than is the case with the pot-furnace factory. The operation of tank furnaces by gas produced from coal has proven very satisfactory, both as to the quality of glass produced and cheapness of cost, indicating, in view of the failing supply of natural gas, the fuel likely soon to be in most general use.

The census year covered a portion of a period of great activity in window glass factory construction on a large and permanent scale, an activity possibly the greatest in the history of the industry. For several years prior to 1900 the establishments operating the largest proportion of the capacity had been getting into closer relations as to regulation of prices and factory operation, resulting in the more or less constant maintenance of an exceptionally good price list. These high prices attracted new capital into the field, and during the census year there were over 30 factories reported which were built within two years. At the close of the census year about 30 window-glass factories were either building or definitely planned, notwithstanding the fact that during the year a close combination of establishments, controlling about 65 per cent of the total capacity, had been effected and prices had been sharply cut to discourage further erection of factories.

In 1900 there were 100 establishments reported as manufacturing window glass, an increase of 19 per cent over the number reported in 1890, and 104.1 per cent over the number reported in 1880. Only 19 more melting furnaces were reported in 1900 than were reported in 1890, but, owing to the greater capacity of the tank, the gain in total pot capacity was 87 per cent. In 1900 there were 165 melting furnaces reported, with a total capacity of 2,429 pots; 146 furnaces of a total capacity of 1,299 pots in 1890; and 76 furnaces with a capacity of 665 pots in 1880; showing a gain since then of 117.1 per cent in number of furnaces, and 265.3 per cent in pot capacity. In 1900 the production was 4,341,282 boxes, valued at $10,879,355; in 1890, 3,768,884 boxes, valued at $9,058,802; and in 1880, 1,864,734 boxes, valued at $5,047,313. There is indicated an increase of 15.2 per cent for 1900 over 1890 in the number of boxes produced, and an increase of 20.1 per cent in the total value of products. Compared with 1880, the number of boxes produced in 1900 increased 132.8 per cent, and the total value of product increased 115.5 per cent. The average value of a box of window glass (50 square feet), according to the census returns in 1900 was $2.51; in 1890, $2.40; and in 1880, $2.71.

Of the 165 furnaces with a total capacity of 2,429 pots reported in 1900, 36 were tank furnaces of a total capacity of 1,327 pots and 129 were pot furnaces that contained 1,102 pots, a decrease from the number of pot furnaces and their total capacity as reported in 1890, of 11.6 per cent and 15.2 per cent, respectively. The great increase in capacity in 1900 over 1890 is confined entirely to the tank furnace, but the total production of 1900 compared with 1890 is not in keeping with this increase, owing to the greatly restricted operation of the factories in 1900, due to a "fire" averaging about six months as against a "fire" of ten months in 1890.

The distribution of the window glass capacity of active establishments in furnaces and pot capacity for

1900 is shown in the following statement, by states, in the order of their importance in capacity:

STATES.	Number of establishments.	Total number of furnaces.	Total pot capacity.	Number of tank furnaces.	Pot capacity.	Number of pot furnaces.	Number of pots.
United States.	100	165	2,429	36	1,327	129	1,102
Indiana	46	83	1,109	17	601	66	508
Pennsylvania	32	48	960	14	588	34	372
Ohio	6	10	128	2	66	8	62
New Jersey	4	6	96	3	72	3	24
New York	5	5	40	....	....	5	40
Maryland	2	5	28	....	....	5	28
West Virginia	2	3	22	....	....	3	22
Delaware	1	2	16	....	....	2	16
Massachusetts	1	2	18	....	....	2	18
Illinois	1	1	12	....	....	1	12

The bulk of the capacity of Indiana was in the counties of Grant, Blackford, Madison, Delaware, and Jay, located in the "gas belt." The capacity in Pennsylvania was largely confined to the Pittsburg district and McKean county. The Ohio plants were at Barnesville, Lancaster, Findlay, and Quaker City. The largest proportion of the capacity located in New Jersey was in Cumberland county. In New York there were 5 factories, 3 of which were in Ithaca, and 1 each in Canastota and Durhamville. The 2 factories in Maryland were located in Baltimore. There was 1 factory in Delaware, located at Wilmington. The only plant in Massachusetts, which was originally established in 1853, was at Berkshire. About 75 per cent of the total capacity was controlled from Pittsburg, Pa., the headquarters of the American Window Glass Company, and about ten other companies. The former owned 39 plants during the census year.

At the close of the census year there was either building or definitely planned new capacity amounting to over 600 pots. Over 100 of these new pots were located in West Virginia; nearly 250 in the district of McKean county, Pa.; about 75 in the coal fields of Illinois and Indiana; 75 in southern New Jersey; and about 75 in the "gas belt" of Indiana.

One feature of the manufacture during the census year was the notable scarcity of skilled workmen. This scarcity, together with the increase in the capacity of the plants, made the total capacity greatly exceed the supply of skilled workmen available for its operation in the four divisions of the work, gathering, blowing, flattening, and cutting. The supply of workmen was about sufficient to operate 2,000 pots, and owing to the strong organization of the men and their strict rules of admission, no considerable relief was possible. The result was that the skilled workmen dominated the industry as seldom before in the history of the trade. The wage scales were the highest in years, and most profitable inducements were offered in addition by manufacturers to secure men for their plants. Every window-glass factory in the country operates under union rules, and the wage scales are settled for each "fire" at conferences of committees representing the manufacturers and the union.

The 5 companies of a "miscellaneous" character shown in Table 13 were all cooperative and engaged in the manufacture of window glass, most of them having been established within the census year, and were financially supported by the union, which loaned money proportioned on the pot capacity of each plant. There were 2 establishments of this character reported in the pressed and blown ware and bottle and jar branch of the industry. It should be stated, in this connection, that there were in the glass industry in addition 9 incorporated establishments of a cooperative character operating under charters, which in all the tables are included under the head of corporations. They are in all essential particulars cooperative associations. This movement toward cooperation arose from the desire to secure more work during the year, the capacity of the factories having been for some time so much in excess of current consumption that the "run" of the factories had been getting less each year, averaging about six months where it was formerly ten. The past record of cooperation in the window glass industry of the United States has been unsatisfactory, all going well as long as the market conditions were good, but financial ruin usually appearing with any depression in the trade. The indications at present are very favorable for cooperative manufacture, and it will probably spread very rapidly in the industry in the near future. The greatest impetus it receives comes from the scarcity of workmen, which is leading manufacturers to organize companies in which a large share of the stock is held by the workmen, who are thus less likely to be tempted away by offers from other manufacturers.

Along with these quasi-cooperative companies many real cooperative companies, composed entirely of the men in the factory, are being established, especially among the Belgian workmen, who form a considerable proportion of the entire working force. The window-glass workers compose the only body of organized workmen in the building-glass manufacturing industry of this country, there being no organization among the plate-glass workers, from whom very little skill is required, machinery doing practically all the work in the factory.

The question of machinery is beginning to agitate the window-glass industry. So far, practically the entire process of manufacture requires skilled hand labor. The growing scarcity of workmen has stimulated efforts to perfect a mechanical process which will do the work now done by the gatherer and blower, and it is probable that eventually the smaller sizes of window glass will be successfully manufactured by machinery.

The average normal consumption of window glass in the United States is estimated at 5,400,000 boxes a year. A considerable portion of this demand is supplied by imported glass, chiefly from Belgium. This market has for years received the surplus window glass of that country, and any advance in American prices at once results in increased importations. The 50-foot box of single strength foreign glass weighs about sixty-two and one-half pounds, and the 50-foot box of double strength, about ninety-two and one-half pounds. In reducing the number of pounds of imported glass to boxes, the average weight of a box is placed at 70 pounds, and it is estimated that 25 per cent of the total glass imported is double strength. The total importation of window glass for the year ending June 30, 1900, was 51,343,339 pounds, or 733,476 boxes, valued at $1,555,924. There were imported 47,202,267 pounds in 1899; 38,908,992 pounds in 1898; 55,961,813 pounds in 1897; 53,182,301 pounds in 1896; 40,786,279 pounds in 1895; 52,437,068 pounds in 1894; 63,715,989 pounds in 1893; 72,682,127 pounds in 1892; 58,932,738 pounds in 1891; and 73,112,550 pounds in 1890. A strike, which was threatened in the Belgian factories at the close of 1900, caused a sharp decrease in the importation of window glass in 1901. The quantity imported during the year ending June 30, 1901, was 27,285,607 pounds.

The American window glass exported during the year ending June 30, 1900, was valued at $36,218, and in 1899 at $32,690. The domestic glass can not compete with the cheaper foreign glass, yet an increasing quantity of American window glass is going into Mexico, Canada, and the West Indies.

PRESSED AND BLOWN GLASS AND BOTTLES AND JARS.

Table 8 presents comparative statistics, by states, of the manufacture of pressed and blown glassware and bottles and jars, for 1890 and 1900.

TABLE 8.—COMPARATIVE STATISTICS, PRESSED AND BLOWN GLASS AND BOTTLES AND JARS, BY STATES: 1890 AND 1900.

[1] Included in "all other states."
[2] Includes establishments distributed as follows: 1900—California, 1: Colorado, 1; Georgia, 1; Michigan, 1; Missouri, 1; Virginia, 2; Wisconsin, 1. 1890—California, 1; Colorado, 1; Georgia, 2; Kentucky, 2; Maryland, 2; Massachusetts, 2; Missouri, 2; Wisconsin, 1.
[3] Not reported in 1890.

Table 8 shows that there were 231 establishments engaged in the manufacture of pressed and blown ware and bottles and jars during the census year, as compared with 194 in 1890, an increase of 19.1 per cent. Of the number in operation in the census year, 84 manufactured pressed and blown flint and lime glassware, such as tableware, jellies, common tumblers, goblets, lamps, chimneys, lantern globes, shades, globes, gas and electric lighting goods, blown tumblers, stem ware, bar ware, opal ware, cut glass, etc. The remaining 147 establishments manufactured bottles and jars in every variety of flint, green, and amber glass. As several establishments had products in both of the above classes and a fair division of their business in each branch could not be made, it was necessary to consolidate the reports of the two divisions. The total value of pressed and blown ware and bottles and jars in 1900 was 45.4 per cent in excess of that reported in 1890, the totals being $39,443,478 and $27,122,708, respectively. Of the total value of pressed and blown ware and bottles and jars in 1900, 55.9 per cent was the value of bottles and jars and 44.1 per cent that of pressed and blown ware, as shown in Table 14. Of the total value of all glass manufactured during the census year, the value of bottles and jars was 38.3 per cent and that of pressed and blown ware, 30.2 per cent.

Pennsylvania ranks first with 32.4 per cent of the total value of products in the manufacture of pressed and blown ware and bottles and jars in 1900. It was first also in 1890, with 39.7 per cent of the total value of products. Indiana, owing to its natural gas, ranked second in 1900, with 22.9 per cent, and sixth in 1890, with 4.3 per cent of the value of products. New Jersey was third in both 1900 and 1890, with 12.2 and 14.4 per cent of the value of products, respectively. Ohio was in fourth place in 1900, with 9.8 per cent of the value of products, but in 1890 was second, by reason of its gas fields, with 15 per cent of the total value of products. Illinois in 1900 retained the rank held in 1890, fifth place, while New York dropped from fourth place in 1890 to sixth place in 1900, on account of the western movement of the factories during the last decade. Reference to Table 14 shows that Pennsylvania leads in the production of pressed and blown ware, reporting 49.5 per cent of the total value of products, while Ohio and Indiana, the next two in rank, report 16 per cent and 15.8 per cent, respectively. West Virginia and New York report 8.1 per cent and 6.9 per cent, respectively. Indiana was the leading state in 1900 in the manufacture of bottles and jars, showing 29.2 per cent of the total value of products; New Jersey, 20.5 per cent; Pennsylvania, 19.2 per cent; Illinois, 12.4 per cent; New York, 5.5 per cent; and Ohio, 4.9 per cent.

The number of establishments reported in 1900 as engaged in the manufacture of pressed and blown lime and flint glassware and bottles and jars was 65.1 per cent of the total number of glass-manufacturing establishments of all kinds. In 1890 they were 66 per cent of the total number. The amount of capital invested in this branch of the industry in 1900 showed an increase of 53.9 per cent over 1890. The average number of wage-earners employed in 1900 was 24.3 per cent greater than in 1890, while the total amount of wages paid showed an increase of 31.5 per cent over 1890. There was an increase of 24.3 per cent in the average number of men employed and 27.5 per cent in their wages; the number of women increased 93 per cent and their wages 168 per cent. The increase in the number of women employed was due largely to the development of the manufacture of decorated ware during the last decade, giving employment to many young women. The average number of boys (practically all children in glass factories are boys) increased only 5.6 per cent and their wages 39.9 per cent. The small increase in the number of boys between 1890 and 1900 was due largely to the strict enforcement of the truant school laws in the principal glass-manufacturing states, which caused a great scarcity of boys, particularly in the bottle factories, and also largely accounted for the increase of 39.9 per cent in wages. The difficulty of obtaining boys is confined to establishments making pressed and blown ware and bottles and jars, practically none being employed in building-glass factories. Their chief duty is to carry the ware from the blower or presser to the annealing department and to attend to the molds, important items in the operation of the factory, so that their absence causes a general curtailment of production.

One result of this state of affairs was a general effort to invent means for dispensing with boy labor. One apparently practicable plan to this end is the use of a portable sheet-iron box or oven, capable of being kept at a satisfactory temperature, into which the ware is placed as it comes from the mold. When the "iron boy" is filled, two laborers carry it to the annealing department and unload the ware into the annealing ovens or lehrs. In this way, it is claimed, several laborers can handle the production of the factory with as much speed and at less cost than when boys are employed. As a result of a recent scarcity, the plan of employing young women or girls was agitated, but this aroused such a storm of indignant protest from all workers that it was never put into operation.

The total cost of materials used in 1900 in pressed and blown ware and bottle and jar manufacture was 60.3 per cent greater than in 1890. The total cost of fuel reported in 1900 is 54.4 per cent in excess of the total reported in 1890, the reported value of natural gas used being 82.2 per cent greater; however, a number of establishments owning their source of supply in 1890 and 1900 made practically no report of cost for gas fuel, but charged the expense against cost of maintenance. A remarkable increase in the use of oil as a fuel is shown, the number of gallons used being 659.1

per cent greater in 1900 than in 1890, while the cost increased 533.4 per cent. The average cost per gallon in 1900 was 3.2 cents, as compared with 3.9 cents in 1890. Ninety-four and three-tenths per cent of the quantity of fuel oil reported as used in glass manufacture in 1900 was used by the factories which manufactured pressed and blown ware and bottles and jars. A large number of small tanks operated with fuel oil, and a large quantity was used in the glory holes, the number of which in the entire industry in 1900 was 61.3 per cent in excess of the number reported in 1890. There was an increase of 57.3 per cent in the quantity of coal used and an increase of only 7.8 per cent in the cost. The average cost per ton in 1900 was $1.52, as compared with $2 22 per ton in 1890. The increased use of the tank furnace, with coal-gas producers using a cheap grade of slack coal, was the cause in a large measure of this decided decline in the average cost per ton.

The total number of furnaces in this branch of glass manufacture in 1900 shows an increase of 52.6 per cent over the number reported in 1890, and the total pot capacity increased 113.7 per cent; of this capacity, 54.8 per cent is contained in continuous and day or intermittent tank furnaces, which were of insignificant number prior to 1890. The use of the continuous tank in this branch of the industry is confined almost entirely to the bottle and jar trade, only 10 being reported in the pressed and blown ware establishments. Bottles of all kinds are being made from the continuous tank, and the bulk of the fruit jar and beer bottle production is made in this manner. Within the last few years flint glass for bottles and jars of such a fair quality has been made in the tank furnace that, taken in connection with the cheaper cost of production and the increased output, flint glass made in tanks for bottleware is rapidly superseding the pot-made flint glass. The adoption of the tank for manufacturing flint-glass bottles has been so general that at the close of the census year the flint-glass bottle blowers, numbering over 2,000, who since 1878 had been joined in a trades union with workmen in 13 other branches of the flint-glass trade, were preparing to leave that association and join with the green bottle blowers' union. This step was finally taken one year later by a large number.

A small decrease in the total number of annealing ovens in use in pressed and blown ware and bottle and jar manufacture was reported in 1900 as compared with 1890, and at the same time the number of annealing lehrs increased 71.1 per cent, showing that the annealing oven is being displaced by the faster and more economical lehr. The principle of the oven method of annealing is the gradual reduction of the heat, while the lehr method is based on the principle of gradually withdrawing the glass from the heat. The new method lends itself more readily to scientific exactness in securing results and, being continuous in operation, makes it possible to handle the increased output of the factory in much less time and at smaller cost.

The manufacture of bottles and jars is the oldest branch of the glass industry in this country, the first glass factory, at Jamestown, Va., in 1608, probably operating exclusively on bottles. It has always formed a prominent part of the industry and in the last decade has made greater progress than any other branch of glass manufacture. The tank furnace, machinery, and improved factory equipments and facilities have resulted in a large increase in the value of products.

Specialization is the prevailing characteristic. A few years ago it was customary for each establishment to manufacture a large variety of ware, and the workman as a rule was accustomed to make a little of everything; but it is now the tendency to restrict the output of the factory to a particular article, and the workman is an expert in one branch of his trade, the general workman having given way to the specialist capable of maintaining the highest speed. This specializing tendency is particularly marked in the manufacture of fruit jars and beer bottles. For years bottles were made in connection with window glass from the same furnace. A survival of this is present in the trade to-day with 5 establishments, manufacturing both window glass and bottles; separate furnaces are used, however.

In no branch of the glass industry has the use of machinery made so great a change as in bottle and jar manufacture during the last decade, and especially the last four years. This applies particularly to the manufacture of fruit jars and wide-mouth ware, such as vaseline jars, jam jars, etc. Prior to 1890 the manufacture of machine-made wide-mouth bottles or jars was largely experimental, and practically no fruit jars had been made by machinery. Since that date the enormous production of small wide-mouth articles, such as vaseline jars, of which one establishment in New York uses 10,000,000 yearly, has been made almost entirely by machines, while fully 90 per cent of the fruit jars are machine-made, and it is only a question of a very short time until the fruit jar will be made exclusively in this manner. The results so far attained indicate that in a few years the bulk of the entire wide-mouth bottle production will be made by machinery.

Prior to the use of machinery, the method of manufacture of wide-mouth ware was to gather the glass from the furnace on a blowpipe, forming it to a suitable preliminary shape in a block or on a marver, and then inserting the glass in a mold and blowing to the desired form. After separating the glass from the blowpipe, a ragged edge of superfluous glass remained attached to the neck of the article, which had to be chipped and ground off to make the product salable. The manufacture of the Mason fruit jar, which since it was patented, in 1858, has constituted 90 per cent of the fruit jar production, has been most completely revolutionized by machinery. Prior to 1896 the glass was gathered from the furnace upon a blowpipe, was then blocked or rolled in a hollow block to get a preliminary shape, then swung by the blower and blown up, rolled on a flat slab or marver, and again blown until it was just large enough to admit of being inserted in the blow mold. The mass of glass was then put into the mold and blown up, so as to completely fill the mold and form a collar of surplus glass extending above the top of the jar about an inch and a quarter. Above this collar was the remainder of a thin bubble into which the blower had formed the glass outside the mold so as to separate it from the blowpipe. This collar and bubble constituted the "blow-over," which had to be removed before the jar was marketable. After being annealed the jar was taken by a workman who, with a file, chipped off most of the "blow-over" and then filed it down as smooth as possible, leaving about one-sixteenth of an inch of the collar remaining, which was finally removed from the jar by the grinding machine. Then the jar had to receive a thorough washing by hand to remove all particles of broken glass and sand resulting from the chipping and grinding. After being carefully dried, the jar was at last ready to pack. The speed with which it was necessary to perform the operations of chipping, grinding, washing, and drying made the risk of breakage great, being estimated at the rate of from 8 to 20 per cent.

By the use of machinery the costly "blow-over" is avoided by first pressing the neck of the jar to finished form and then forming the body of the jar by blowing, so that when the jar leaves the blow mold to be annealed it is, so far as form is concerned, a marketable article. The process patented July 11, 1882, by Philip Arbogast, of Pittsburg, Pa., has been the basis for all machinery used in the manufacture of jars and wide-mouth bottles. He employed two separate molds, a press mold and a blow mold. Sufficient glass to make the desired article was taken from the furnace on a solid rod or punty and dropped into the press mold, the required quantity being separated from the mass on the punty by shears in the hands of a workman. A lever operated by the workman then brought down a plunger into the mold, pressing the mouth or neck of the article to finished form and pressing a wind cavity in the dependent mass of glass to aid in the blowing operation. The plunger being withdrawn, the mold was opened, and the ring inclosing the pressed neck with the dependent mass of glass was carried to the blow mold and inserted, after which the body of the article was blown up to the desired form. From 1884 to 1893 this process was followed in a small way on large candy and druggists' jars, wide-mouth bottles, vaseline and jam jars, milk jars, and tableware, such as bowls, pitchers, sugars, and creams, but the principal products were large drug and candy jars, which, after having the necks pressed to the finished form, were taken out of the press mold and greatly increased in size by manipulation of the blower before being placed in the blow mold. In 1893 the process began to be more extensively used on vaseline jars.

The idea of dispensing with the manual operation of transferring the glass from one mold to another was patented in England in 1886, both molds being combined into one by the use of sliding parts. About the same time the idea of placing a series of molds on a revolving table was also patented in that country, and patents were granted in the United States in 1889 on both devices, but they were never put into practical use. In 1896 an American combined the consolidated mold and rotary table. On a rotating table is placed a series of five separate, duplicate, double molds, each mold containing an outer blow section having a ring integral with it in which the neck of the article is pressed, and a telescopic press section rising within the blow section and receiving the glass, forming, with the neck of the blow section, a press mold. The glass is dropped into the combined mold when in this press mold position, and the table rotated, bringing the mold under the plunger, which enters it and presses the neck, and wind cavity into the dependent mass of glass. The plunger is withdrawn, and another rotation of the table brings the mold under the blow stem, the telescopic press section of the combined mold having dropped in the meantime, exposing the glass blank within the blow section. The bottom plate is inserted and the air admitted to expand the glass blank to the form of the blow mold. The next rotation of the table brings the mold to where it is opened by a boy, and the finished article is taken out and removed to the annealing oven.

All of the above operations are performed simultaneously, a finished article being produced at each rotation of the table. On such a machine the first commercially successful machine-made Mason fruit jar was manufactured in July, 1896, at the plant of the Atlas Glass Company at Washington, Pa. The numerous jar and wide-mouth bottle machines now in use have either separate blow and press molds arranged near together on a revolving table so that the shifting of the glass from one to the other is almost instantaneous, or have the molds combined in one. In all, the basic principle is the pressing of the finished neck and the subsequent blowing of the body. Compressed air for blowing and electricity for motive power have added much to the speed of the operation. The machine has a much greater productive capacity than is possible by the old hand method of blowing, and has reduced the cost of manufacture more than a third. Loss by breakage has been reduced to a minimum, while the finish of the ware is far superior to that of the handmade article.

So far, the manufacture of narrow neck bottle ware by machinery is not beyond the experimental stage in this country, although commercial success is claimed in Germany and Russia. The claim is made by the best authorities that the manufacture of narrow neck bottles by machinery will soon be perfected and become as general as the mechanical production of wide-mouth ware. The method employed at present in making narrow neck bottles is to gather a suitable amount of glass from the furnace on the blowpipe, to roll it on a marver or turn in a block, to swing and blow and again roll on the marver to give it the proper form for insertion in the mold, where it is blown, forming the body and neck of the bottle. The article is then taken from the mold and carried to the glory hole, where the top of the neck is reheated and the ring or lip of the bottle neck is formed by the workman with a finishing tool, after which the bottle is ready for annealing. The greatest advance made so far in the mechanical production of narrow neck ware has been in the finishing process, although the finishing machine, as yet, is used to but a limited extent.

The number of fruit jars reported in 1900 was 789,298 gross of different sizes—pints, quarts, and half gallons—valued at $2,935,036. It is estimated that about 90 per cent of these were the Mason patent jar, which has a screw threaded neck for a metallic cap which presses down a rubber band on the shoulder of the jar, making a perfect seal. The other jars manufactured were more expensive kinds with special sealing devices, of which that with an all-glass top was the favorite. There were 34 establishments engaged in the manufacture of fruit jars during the census year, 6 of which made that class of ware exclusively. The largest fruit jar plant in the world, with a daily capacity of 240,000 jars, all machine-made, is in Indiana. Comparison with the statistics of the last two censuses shows a great development in this branch of the industry, caused principally by the introduction of the continuous tank in the last decade and the adoption of machinery within the last four years. In 1890, 268,978 gross of fruit jars were reported, valued at $1,390,430. There was an increase of 193.4 per cent in the number manufactured in 1900 over 1890. The average value per gross in 1900 was $3.72 as compared with $5.17 in 1890, a decrease of 28 per cent in the value per gross.

The statistics of fruit jars manufactured at the census of 1880 are incomplete, yet the total of 148,271 gross reported for Pennsylvania, New York, and New Jersey probably comprised very nearly the production of the entire country. The increase in the quantity manufactured in 1900 over 1880 was 432.3 per cent. No fruit jars were reported in Indiana in 1880; but this state headed the list in 1890 with 83,270 gross, valued at $440,657, or 31 per cent of the total production, and also in 1900 with 559,549 gross, valued at $2,106,250, or 70.9 per cent of the total production. Pennsylvania, which was first in 1880 in the manufacture of fruit jars, 67,770 gross having been reported, was third in 1890, with a product of 47,250 gross, valued at $233,125, and second in 1900, with 115,000 gross, valued at $436,104. Ohio was second in the manufacture of fruit jars in 1890 by reason of the discovery of natural gas, 60,726 gross, valued at $296,065, having been reported, while in 1900 the number had dwindled to 2,000 gross of a special kind, valued at $8,000. In 1880 there were 51,749 gross reported as manufactured in New Jersey; in 1890, 33,406 gross, valued at $181,410; and in 1900 this state reached third place, with 61,871 gross, valued at $192,467. In New York there were 28,752 gross manufactured in 1880; in 1890 there were reported 9,500 gross, valued at $55,000; and 31,235 gross, valued at $128,965, in 1900, an increase in the number manufactured of 228.8 per cent over 1890. The statistics for Illinois show a large decrease in fruit jars manufactured since 1890, the number reported in 1900 being 1,500 gross, valued at $9,000, compared with 20,750 gross in 1890, valued at $103,798. In West Virginia, from which no fruit jars were reported in either 1880 or 1890, there were manufactured 14,643 gross, valued at $43,750, in 1900.

At the close of the census year large quantities of fruit jars, roughly estimated at 340,000 gross, were being held in stock and were controlled by a selling agency formed among the principal manufacturers. A large portion of this stock was held by one firm, which had thousands of jars stacked in an open field. This stock had accumulated for several years and was held in prospect of the approaching failure of the natural gas and the consequent advance in prices.

The manufacture of prescription bottles, vials, and druggists' ware was carried on by 77 establishments in 1900, several of the largest factories in the country being operated almost exclusively on this class of goods. The value of these products in 1900 was 21.5 per cent of the total value of all bottles and jars manufactured. The statistics reported in 1890 of bottles and jars manufactured are of no value for comparative purposes, as they were not complete. However, the total number of bottles reported in that year, exclusive of beer bottles, was 2,170,961 gross. The average value per gross of this class of ware in 1900 was $1.92, which was a considerable reduction from the value per gross in 1890. This was due to the increased quantity of ware produced from the continuous tank furnace. Of the total quantity of this class of ware manufactured in the United States in 1900, 30.2 per cent was made in New Jersey, constituting 28 per cent of the total value, the average value per gross for the state being $1.79. Indiana ranked second, with 25.7 per cent of the total quantity and 25.4 per cent of the total value of the products, the average value per gross for the state being $1.90. Pennsylvania, by reason of much of the product of that state being of higher grade, closely followed Indiana in the value of the products, producing 25.4 per cent of the total value and 22.7 per cent of the total quantity, the average value per gross being $2.12. In Illinois 11 per cent of the total quantity and 8.7 per cent of the total value was manufactured, the average value per gross for the state being $1.52. A large part of the southern trade was supplied by that state. The manufacture of homeopathic vials was carried on by 4 glass making establishments. These vials were also made during the census year in a large number of small shops where the tubing is bought and reworked. No account of these shops is taken in this report. The American prescription bottle has no superior in form and finish, and is far in advance of the ware manufactured abroad. Export shipments of this class of ware direct from factories in 1900 were reported to Canada, Australia, South and Central America, Cuba, Great Britain, France, Africa, East Indies, China, and Japan, of a total value of $93,094, which represented only a portion of the actual exportation, as the most of the trade was done through exporting houses.

The manufacture of beer, soda, and mineral water bottles in 1900 was reported by 75 establishments in 15 states, the total value of which was $5,075,068, or 23.4 per cent of the total value of all bottles and jars manufactured. Several establishments were employed almost exclusively in the manufacture of beer and soda bottles, the bulk of the trade being done by them. Plans were being prepared at the close of the census year for 6 new establishments to manufacture beer and soda bottles exclusively, while increases of capacity among established plants were general, nearly all being in the line of continuous tanks. Demand for ware in the census year was extraordinary, the home consumption being unusually large, while large quantities of bottles filled with beer were shipped to Cuba and the far East. The export trade in beer and soda bottles with Mexico reached its highest development during the census year, direct factory shipments aggregating 21,147 gross, valued at $66,333, being reported for that country. The manufacture of mineral water bottles largely increased during the decade and was unusually large during the census year. By far the largest part of the production in this branch of the industry was made from the continuous tank furnace.

The general use of the tank and better facilities for the maintenance of a high rate of speed by the workmen have resulted in a great increase in the average factory output within the last ten years, yet consumption at the close of the census year was demanding still greater capacity, and prices were at a high point. In 1890 a production of 204,948 gross of beer bottles was reported, the figures probably not being complete, but showing nearly all of the country's production in that year; this was exceeded in 1900 by Illinois alone, with 4 establishments reporting. As in 1890, Illinois in 1900 was first in the manufacture of beer, soda, and mineral water bottles, with 26.3 per cent of the total value and 30.1 per cent of the total quantity manufactured in the United States. Pennsylvania ranked second in value of products, with 17.8 per cent of the total, but the quantity manufactured was only 10.9 per cent of the total quantity. Establishments in Ohio reported 12.6 per cent of the total value and 16.2 per cent of the total number of gross, while the production in New York constituted 9.9 per cent of the total quantity and 9.3 per cent of the total value. A large percentage of the total value and quantity was reported under the head of "all other states," which came chiefly from Wisconsin and Missouri, each having a large establishment devoted to the exclusive manufacture of this class of ware. California, Colorado, Georgia, Michigan, and Virginia were the other states included under this head. New Jersey, with a production slightly less in quantity, led Indiana in the total value of beer, soda, and mineral water bottles manufactured. Following Indiana in this class of ware were Maryland, West Virginia, and Massachusetts, in the order named.

There were 81 establishments engaged in the manufacture of flasks and liquor bottles in 1900, the total value of the products being 11.1 per cent of the total value of bottles and jars manufactured, Indiana heading the list with 50.2 per cent of the total value and 61.4 per cent of the total quantity. There were several small establishments equipped with tank furnaces in this state operating exclusively on flasks with very cheap gas fuel, and cheap unorganized labor, that created considerable demoralization in prices and in the trade of the old establishments. To counteract this, the American Flint Glass Workers' Union, to which the organized flask workers belong, at the close of the census year was erecting a tank factory in Indiana to be operated exclusively on flasks, which were to be sold at prices to compete with these new firms, and thus to either force them out of the business or cause them to maintain prices and working conditions equal to those in force among organized manufacturers. This movement is unique in the history of trades unions, and is based on the principle that there is greater economy and efficiency in direct business competition than in the old method of taking men out on strike and supporting them on a relief roll. Pennsylvania was next to Indiana in the manufacture of flasks and liquor bottles, 14.5 per cent of the total quantity and 18.6 per cent of the total value being manufactured in that state. Liquor bottles and flasks were also manufactured in California, Georgia, Illinois, Maryland, Massachusetts, Michigan, New Jersey, New York, Ohio, Virginia, West Virginia, and Wisconsin.

The manufacture of milk jars or bottles is practically a development of the last decade. The demand has steadily increased, causing a corresponding increase in the furnace capacity used in the manufacture of this class of ware. The manufacture of milk jars was reported in 1900 by 31 establishments, 13 of which were located in Pennsylvania. The total value of milk jars of all sizes manufactured in 1900 was 3.4 per cent of the total value of all bottles and jars manufactured. The average value per gross for the United States was

$4.99. The mechanical production of milk jars is commercially possible, and it is probable that a large part of the product will be made by machinery during the present decade. The manufacture of milk jars was one of the most rapidly expanding branches of the glass trade at the close of the census year, the overwhelming merits of such a package for milk becoming more widely recognized and the demand steadily increasing. Pennsylvania led the productive list, with 55.1 per cent of the total quantity and 59.6 per cent of the total value. The percentages of the total quantity and total value of milk jars manufactured in the other states in 1900, are as follows: New Jersey, 13.5 per cent of the quantity and 14.7 per cent of the value; Indiana, 13.4 per cent of the quantity and 7.6 per cent of the value; Illinois, 5.1 per cent of both quantity and value; New York, 4.7 per cent of the quantity and 4.6 per cent of the value; Ohio, 4.1 per cent of both quantity and value; West Virginia, 3.1 per cent of the quantity and 3.2 per cent of the value.

The manufacture of bottles for patent and proprietary medicines is largely confined to the states of New Jersey, Illinois, and Indiana, although 47 establishments in 8 states were reported as engaged in the manufacture of such products. The value of bottles for patent and proprietary medicines manufactured in 1900 was 12 per cent of the value of bottles and jars of all kinds reported. The combined production of New Jersey, Illinois, and Indiana was 88.6 per cent of the total quantity for the United States. Bottles of this kind are made of a cheaper grade than prescription bottles and are used in steadily increasing quantities, a large quantity being exported filled. New Jersey for a long period has been first in the manufacture of this class of ware, and in 1900 there was reported from that state 46.4 per cent of the total quantity and 53.7 per cent of the total value for the United States. From Illinois was reported 23.4 per cent of the total quantity and 19 per cent of the total value; and from Indiana 18.9 per cent of the total quantity and 14.5 per cent of the total value. Bottles for patent and proprietary medicines were also manufactured in Pennsylvania, New York, Ohio, Maryland, and Georgia.

The manufacture of bottles and jars for the packing and preserving industries, exclusive of the enormous production of fruit jars, has steadily advanced during the past decade, owing to the remarkable growth of the above interests and the increasing recognition of glass as the ideal package. In this branch of the bottle and jar industry the value of the product in 1900 was 9.8 per cent of the total value of all bottles and jars manufactured, and 45 establishments in 10 states reported. The products covered a wide range of glass food packages, the average value being $2.70 per gross. The manufacture of machine-made ware in this line is increasing, although constituting as yet a very small proportion of the total. The 3 leading states in the manufacture of bottles and jars for packers and preservers were New Jersey, Indiana, and Pennsylvania. In New Jersey, 35.6 per cent of the quantity and 29.3 per cent of the value of these products was manufactured; in Indiana, 31.6 per cent of the quantity and 32.4 per cent of the value; and in Pennsylvania, 14.5 per cent of the quantity and 19.8 per cent of the value. Illinois followed, with 10.3 per cent of the quantity and 9.2 per cent of the value. This class of ware was also manufactured in Ohio, New York, California, West Virginia, Maryland, and Georgia; these states reporting in the order given as to quantity and value of product.

The number of demijohns and carboys manufactured in 1900 was 83,243 dozens, valued at $206,061. The average value per dozen for the several states varied with the proportion of the state's output of the more expensive carboy or the cheaper demijohn, the average value of the carboy being about twice that of the demijohn. New Jersey was first in the value of demijohns and carboys manufactured in 1900, with 42 per cent of the total value, followed by Illinois with 23.8 per cent of the total value, Pennsylvania with 17.9 per cent, and New York with 9.2 per cent. Under the head of "all other products," bottles and jars which were not specified, valued at $940,277, were reported. A large variety of ware was embraced under this head. During the census year the manufacture of large glass jars and retorts for laboratory use and for water coolers was successfully accomplished in this country, the process having been brought from France.

There was no such close organization of manufacturing interests in the bottle and jar industry during the census year as in the plate glass, window glass, and tableware industries. Eastern and western manufacturers of bottles have relied upon a common understanding to regulate prices, with varying success, particularly in some lines such as flasks and prescription bottles. The manufacture of beer bottles was controlled by a few firms, and very satisfactory results in keeping prices uniform were the rule. The prices of fruit jars were regulated by a selling agency agreement among controlling manufacturing interests. The workmen in both the green and flint bottle and jar trades were well organized and their rules as to duration of factory operation and a uniform scale of wages, which affected a large majority of the factories in all branches of glass manufacture, were the strongest factors in maintaining uniformity of prices. The green bottle blowers' organization, the Glass Bottle Blowers' Association, organized about 1877, is one of the best managed and most progressive trades unions in the United States, and had a membership of about 4,000 and about $100,000 in cash in the treasury at the close of the census year. The organization of flint or prescription bottle blowers numbered about 1,500, and formed a branch of the American Flint Glass Workers' Union, one of the largest trades unions in the country. The scale of wages and the duration of the summer stop of the factories are fixed each year at a meeting of a joint committee representing organized workers and manufacturers. The only company stores in the glass trade in 1900 were in the bottle and jar branch of the industry. There were 10 of these stores, but in only two instances were the glass workers compelled to trade with them, as had been customary a short time before, the blowers' union having conducted a successful strike chiefly against the company store system. In 1890, 20 company stores were reported, 11 in connection with factories making bottles and jars and glassware, 8 in window glass works, and 1 in the plate glass branch. In 1880 there were 27 reported, as follows: 13 in connection with factories making bottles and jars and glassware, 12 in window glass works, and 2 in the plate glass branch.

Table 9 is a statement, by states, of the number of bottles manufactured, classified by capacity.

TABLE 9.—NUMBER OF BOTTLES MANUFACTURED, CLASSIFIED BY CAPACITY, BY STATES: 1900.

STATES.	BOTTLES.		
	4-ounce and under, number of gross.	4 to 16-ounce, inclusive, number of gross.	Over 16-ounce, number of gross.
United States	2,462,694	3,055,204	1,228,719
California	4,600	22,486	25,187
Georgia	13,000	17,000	7,350
Illinois	428,077	430,636	239,285
Indiana	562,345	872,318	199,947
Maryland	113,898	48,960	8,969
Massachusetts	...	4,865	1,561
Michigan	3,876	10,425	1,670
Missouri	...	46,667	23,333
New Jersey	764,385	614,385	130,046
New York	57,321	196,790	254,074
Ohio	74,015	195,054	94,338
Pennsylvania	405,528	496,670	199,310
Virginia	34,000	22,000	9,000
West Virginia	1,649	34,948	6,649
Wisconsin	...	42,000	28,000

It is possible that the statistics presented in the above table are not strictly accurate, as several establishments were unable to furnish more than an estimate of the number of bottles of each size manufactured. The total number of the three classes of bottles exceeds the total number reported in Tables 12 and 14 as "prescriptions, vials, and druggists' ware," "beers, sodas, and minerals," "liquors and flasks," and "patent and proprietary." This is probably accounted for by the fact that a large number of bottles included in the statement were not reported under either of the foregoing classifications, but were reported on the schedule under "all other products."

Pressed and Blown Glassware.—Pressed and blown lead and lime glassware manufactured in the United States is characterized by purity of color, excellence of design and finish, and cheapness of cost. The United States has been preeminent in the manufacture of pressed glassware ever since the invention of the process, which occurred about 1827 at a little plant in Sandwich, Mass., as the result of a suggestion of a carpenter who knew nothing of glass manufacture. His idea that molten glass could be pressed into any desired shape was at first regarded as absurd by experienced glass manufacturers.[1] Prior to this all glassware was blown, either offhand or in a mold, which required much greater skill and more time than the pressing operation.

About 37 years after the first glass press was constructed another important discovery was made, which so improved the composition of the batch for lime glass that, in purity and brilliancy, lime glassware was made to rival the more expensive lead glassware. Lime glass had been used in Europe and England for centuries in the manufacture of window glass, bottles and jars, and common tableware, and from an early period it had been used in the United States in the manufacture of tableware. But it was so inferior in purity and luster that it could not compete with lead glass, and was restricted to the cheapest and lowest grade of ware.

In 1864, according to the authority noted above, William Leighton sr., a glass manufacturer of Wheeling, W. Va., by the substitution of bicarbonate of soda for soda ash, and a better proportion of the materials in the batch, manufactured a lime glass that equaled in beauty the finest lead glass. This placed lime glass on a basis of competition with lead glass at less than one-half the cost. The almost immediate effect was a complete revolution in the manufacture, the production of lime glass rapidly increasing, while that of lead glass for tableware was soon reduced to a comparatively small quantity. The lime glass was not only cheaper, but had to be worked quicker than the lead glass, resulting, in connection with the use of the press, in a largely increased output.

The quantity of pressed ware manufactured has been greatly increased in the last decade by the removal of the arbitrary limit placed on the number of pieces to be made in a "turn" by the worker, and by the improvement of the old-style press by adding a rotating table carrying a series of molds, and operated by steam, compressed air, or electricity. The effectiveness of these improvements has been further increased by elaborating on the old wind system for cooling molds and workers. This increase in the speed of the old press without changing its basic form, and in that of the fire polishing and finishing operation, have been the notable changes during the last twenty years.

The effort to increase rapidity of production, especially in the last decade, was the principal characteristic of the pressed-ware trade. So well has this succeeded by the use of the improved press and continuous tank, that it has resulted in a large increase in the quantity manufactured, of common tumblers and jelly glasses, cheap, unfinished tableware, common lamps, etc., and a

[1] Tenth Census of the United States, "Report on Glass Manufacture," by Joseph D. Weeks, special agent, page 58.

large reduction in cost, although the best grade of pressed ware is still made on the old hand press. For years American pressed tableware has been unrivaled in brilliancy and in its close imitation of the real cut glass, the fire-polish finish being the greatest factor in this success. In beauty and variety of design, pressed tableware has equaled if not surpassed the real cut ware, new designs being produced each year in great profusion and at large cost.

During the last decade great mechanical progress has been made in the blown glass branch of the industry, but not to such an extent as in the production of fruit jars. Since 1897 a large number of thin blown tumblers have been made by machinery, and the same machine has been successfully applied to the manufacture of lamp chimneys, although trade conditions have restricted its advantages and prevented its operation in the manufacture of the latter to the extent reached on tumblers. In the manufacture of both tumblers and lamp chimneys, the machine greatly increases the output and lessens the expense of skilled labor. The machine has a circular table revolving around a central column or standard, the table carrying a series of duplicate molds, usually six. After the ball of glass has been gathered from the furnace on the blowpipe to the size required for the desired article, it is placed in the mold, which is closed, and the blowpipe held in place perpendicularly over the mold by a clamping device at the top of the machine, which engages with the upper end of the blowpipe. Over the mouthpiece of the pipe is placed a rubber hose which leads to a supply of air, furnished either by a compressing pump, or, if light pressure is required, as with some tumblers, by a fan system. The mechanical rotation of the table admits the air into the pipe, which is kept revolving, and blows up the glass in the mold until it is ready to be turned out for the finishing process. Ingenious mechanism regulates the air pressure. The entire operation is performed with great rapidity and it is claimed that the output of the machine is limited only by the ability of the workmen to supply the glass. The mechanical finishing of ware is now engaging the special attention of manufacturers, and a completely mechanical process, requiring small labor cost to perform the entire operation of finishing the ware after its removal from the blowpipe or mold, is the object sought. Manufacturers generally are of the opinion that more real progress will result from improvements in the finishing process than from further improvements in the mechanical process of making the ware. While the high-speed machine is a success on ordinary ware, both pressed and blown, the manufacture of high-grade ware seems to require the sympathetic touch of the skilled workman.

The manufacture of pressed and blown ware in 1900 was done almost entirely in Pennsylvania, Ohio, Indiana, West Virginia, and New York, only 3.7 per cent of the total value of such products being reported in Massachusetts, Illinois, Maryland, New Jersey, and Colorado. Specialization in manufacture was carried far in many lines, particularly in the manufacture of chimneys, tumblers, and lamps. Competition in nearly all lines was very active, particularly during the latter part of the decade, creating a strong tendency toward concentration of capacity along special lines, so as to manufacture at the lowest possible cost. The more rapid and safer handling of the ware, economy of working space in the factory, and facilities and conveniences for adding to the efficiency of the working force were considerations that received the greatest attention. Competition was so intense at the opening of the census year that all previous agreements between manufacturers as to prices were useless, and consequently prices of pressed and blown ware were unusually low. This was the principal cause of the formation of two close consolidations and additional general associations for the regulation of prices. The result was a decided improvement in prices during the latter half of the year. In July, 1899, a consolidation was effected of 7 establishments which manufactured lamp chimneys exclusively, and on November 1, 1899, 19 large pressed and blown ware establishments, equipped with about one-half of the available capacity of the United States, making a general line of tableware, tumblers, and novelties, came under the control of one central company. In 1891 a similar consolidation of 13 tableware establishments, principally in the immediate neighborhood of Pittsburg, Pa., was formed, and the number of plants was increased later. During the census year this company operated only 6 factories, 3 of which were in Pittsburg.

In the early part of the census year nearly all the manufacturers of pressed and blown ware agreed in forming an association to effectively maintain prices, and so successful was this association that on many articles unusually low prices, caused by sharp competition, were succeeded by quite profitable prices, which were well maintained. The association in attaining this end enlisted the aid of the jobbers by the establishment of a liberal rebate system, similar in some respects to the plan adopted by the consolidation of window glass manufacturers in the same year, although the latter went to the extent of forming the jobbers into an incorporated body pledged to cooperate with the manufacturing interests. The several consolidated companies engaged in the manufacture of glass established their headquarters in Pittsburg, which city, although it had lost nearly all the glass factories that had made it famous as the center of American glass manufacture, controlled more completely than ever, at the close of the census year, the manufacture of glass in the United States. Pittsburg was also the headquarters of all the glass-workers' associations, except that of the green bottle blowers, which was at Philadelphia. A large majority of the skilled workmen in the pressed and blown ware industry were members of the American Flint Glass Workers' Union, which was organized in 1878, and embraced the workmen in 14 different branches of the trade. The membership was about 7,000 and the treasury contained about $100,000. By means of this organization the manufacture was carried on under a practically uniform wage scale and with concerted action as to factory operation.

The manufacture of tableware, which consists of pressed and blown articles in sets ranging from two or three pieces to over a hundred, of very great variety of form and size, was confined to the 4 states of Pennsylvania, Ohio, Indiana, and West Virginia, in the order named. Twenty-seven establishments reported products valued at $2,617,784, or 15.3 per cent of the total value of all ware made in the pressed and blown division of the industry, and numbering 65,514,100 separate pieces. There was a very great variety in the value of the different kinds of ware, but the average value per 100 pieces for the United States was $4.

In Pennsylvania 55.7 per cent of the total quantity, and 60.6 per cent of the total value, was manufactured, and the average value per 100 pieces in that state was $4.35. A large proportion of the product for the state was manufactured in the Pittsburg district. In Ohio 23 per cent of the total quantity, and 25.5 per cent of the total value, was reported, and the average value was $4.43 per 100 pieces. The great bulk of the product was manufactured in the valley of the Ohio River. By the substitution of glass of a cheap quality made in tanks for glass made in pots, and worked with the press at higher speed than customary, and by dispensing with the fire-polishing operation, a class of cheap unfinished tableware and other glassware was manufactured in Indiana during the closing years of the last decade. This largely accounts for the fact that only 11.1 per cent of the total value of tableware manufactured in the United States, compared with 19.3 per cent of the quantity, was made in that state. The average value per 100 pieces was $2.31. The manufacture of tableware in West Virginia was conducted entirely along the banks of the Ohio River, and 2 per cent of the total quantity, and 2.8 per cent of the total value, was manufactured there, at an average value of $5.48 per 100 pieces. A considerable proportion of the product was blown ware.

Considerable rivalry exists among the manufacturers of pressed tableware in the production of attractive designs and decorations. Most of the ware is in imitation of cut ware, and so highly has the art been developed that a careful examination is frequently required to detect the difference. It is the custom with a majority of the establishments to offer new designs at the opening of each year, a large amount of money being expended to secure these designs and to prepare the required molds. The profitable life of a design, unless it is unusually popular, is limited to one season, its place being taken by some new idea expected to better catch the popular fancy. A popular design will, in one season, prove extremely profitable, while the losses on unpopular designs are so great as to make the expression of the public's favor an exceedingly interesting matter to the manufacturers. Popular favor has changed in the last decade from imitation cut ware to plain ware, and from that to highly decorated ware, but the imitation cut ware has been in most constant demand, although within the last few years colored ware and plain crystal with gold decorations have been strongly favored. Within the last half of the decade the manufacture of colored ware, to compete with the influx of imported Bohemian ware, has been assuming shape, and it seems probable that this profitable field will not much longer be left wholly undisputed to the foreign manufacturer.

Tableware has long formed a large proportion of the exports of glass from the United States, by reason of its superiority of color and design. The export branch of the business received special attention in 1900, traveling representatives having been sent through South America, Australia, and the United Kingdom, and a number of permanent agencies were established by the larger interests. For a long period large quantities of American tableware have been used in Canada, and a field of large proportions is being opened in Australia, one glass manufacturing establishment during the census year, having made a single direct shipment to that country of 10 cars, or about 1,500,000 pieces, a small part of which was common lamps. Thirteen establishments reported exports direct from factory of a total value exceeding $100,000, to Canada, Australia, Mexico, South America, Cuba, Hawaii, England, and Germany. This represented only a small part of the total exports of tableware during the census year, as the bulk of the trade was done through exporting houses. A growing tendency has been noted on the part of the manufacturers to export direct from the factories, and foreign needs are being closely studied with a view to the increase of the export trade in the future.

Jelly glasses and pressed tumblers and goblets, 102,528,600 pieces in number, valued at $2,007,386, were manufactured by 28 establishments in 5 states in 1900. The value of such ware was 11.8 per cent of the total value of all pressed and blown ware manufactured in the United States. The average value was 23 cents per dozen.

In Pennsylvania 36.4 per cent of the total quantity and 39.5 per cent of the total value was manufactured, and the average value for the state was 25.5 cents per dozen. The proportion manufactured in Indiana was 31.4 per cent of the total value and 35.7 per cent of the total quantity, at an average value of 21 cents per dozen. From Ohio was reported 9.6 per cent of the total value and 19.7 per cent of the total quantity, at an average value of 23 cents per dozen. The remaining 9.5 per cent of total value and 8.2 per cent of total quantity was manufactured about equally in Maryland and West Virginia, at an average value of 27 cents per dozen. At the close of the census year two large establishments, intended solely for the manufacture of jelly glasses and tumblers, were being built in West Virginia, and a large establishment was being erected in Ohio for the manufacture of the same class of ware by machinery and methods that were expected to still further reduce the cost and increase the possible output.

At the censuses of 1880 and 1890 incomplete returns were made of the manufacture of tumblers and goblets. In 1880, 46,415 dozen "tumblers" were reported from Massachusetts, 409,713 dozen from Ohio, and 2,500,000 dozen from Pennsylvania. In 1890, 5,438,700 dozen "tumblers and goblets," valued at $555,273, were reported as manufactured in Ohio; and 2,481,600 dozen, valued at $780,059, in Pennsylvania. The use of jelly glasses and tumblers in the packing trade is steadily increasing and there has been a steady growth in the exports.

Lamps manufactured in 1900 numbered 807,765 dozens, valued at $1,498,675, or $1.86 per dozen. They were in many varieties, from the most common pressed lamps to those ornately fashioned, and their value was 8.8 per cent of the total value of all pressed and blown ware. By far the largest proportion consisted of the commonest pressed grades. The manufacture was confined to 6 states and 27 establishments, several of which made a specialty of highly decorated lamps. The largest factory in the world making decorated lamps exclusively was located in Pennsylvania. Great progress was made during the last decade in the manufacture of decorated lamps of a medium grade, and this branch of the industry is receiving increased attention.

In Pennsylvania 65.6 per cent of the total value and 56.4 per cent of the total quantity was manufactured, at an average value of $2.16 per dozen. The largest proportion of Ohio's total product was common lamps; the quantity manufactured was 23.7 per cent of the total quantity, and the value 12.4 per cent of the total value, with an average value of 97 cents per dozen. In West Virginia, with the bulk of the production of decorated lamps, 18.4 per cent of the total value and 7.6 per cent of the total quantity was manufactured at an average value per dozen of $4.47. The lamps manufactured in Indiana were largely of a cheap grade; the quantity manufactured was 10.1 per cent of the total quantity, and the value 2.9 per cent of the total value, at an average value of 53 cents per dozen. Lamps were manufactured also in New York and Massachusetts, the product of the former state being largely common lamps, and that of the latter a better grade of ware.

The use of the tank in lamp manufacture has made possible a considerable reduction in cost from that of the old pot-melting method which was in general use in 1890. The manufacture of pressed lamps has been steadily increasing, resulting in a large reduction in the cost of the common article.

The value of lamp chimneys manufactured in 1900 was $2,719,583, the greatest in value of any single product reported under the pressed and blown glass branch of the industry, and was 15.9 per cent of the value of all pressed and blown glassware. The manufacture was reported in 6 states, but 90.4 per cent of the total value of products was manufactured in Indiana, Pennsylvania, and Ohio. The average value per dozen for the United States was 39 cents. Indiana led, with a product constituting 45.1 per cent of the total quantity and 44 per cent of the total value, the average value being 38 cents per dozen. Pennsylvania was second with 26.6 per cent of the total quantity and 23.5 per cent of the total value, at an average value of 35 cents per dozen. The quantity of lamp chimneys manufactured in Ohio was 21.9 per cent of the total, and the value 22.9 per cent; the average value per dozen was 42 cents. The remaining states in which lamp chimneys were manufactured were Illinois, New York, and Massachusetts. There were 27 establishments engaged in the manufacture.

A comparison of the statistics for 1900 with the incomplete statistics for 1890 and 1880 shows how the manufacture of chimneys has moved westward, following the natural gas and cheap fuel, and also gives some idea of the extent the production has been curtailed by the increased use of gas and electric light. The total number reported in 1890 was 7,534,473 dozens, valued at $1,816,016, and distributed as follows: Ohio, 4,025,120 dozens, valued at $541,836; Pennsylvania, 2,885,841 dozens, valued at $1,017,639; New York, 623,512 dozens, valued at $256,541. In 1880 the total number reported for the United States, no value being given, was 4,463,140 dozens, distributed as follows: Pennsylvania, 2,719,649 dozens; New York, 888,639 dozens; Ohio, 743,140 dozens; and Massachusetts, 111,712 dozens. No lamp chimneys were reported as manufactured in Indiana in either 1880 or 1890; this state was first, however, in 1900 in this branch of the industry, and succeeded Ohio, which was the leading state in 1890. This change in the relative positions of these two states was coincident with a similar change in the supply of natural gas. A decrease of 8.4 per cent in the total quantity manufactured in the United States is shown from 1890 to 1900, while the total value in 1900 exceeds that of 1890 by 49.8 per cent; this was due largely to the extremely low value reported for the product of Ohio in 1890, which was more than one-half of the total quantity reported at that time.

During the last decade the improvement in the manufacture of lamp chimneys was shown by better quality and a greater variety of design. There has been a large increase in the use of higher grade chimneys of special design. Special attention has been given to the package for fine grade ware, and a large number of such chimneys have, within the last few years, been packed in separate cartons, resulting in a decided improvement in appearance and in safety of shipment.

The manufacture of lamp chimneys by the blowing machine was limited to two factories in 1900, and in only one of these plants was it carried on extensively, being confined largely to a cheap class of goods. Machine-blown lamp chimneys will probably represent a large proportion of the production in the near future, although it is questioned if the higher grades of chimneys will not require hand work. During 1900 the lamp chimney market was fairly well regulated by an agreement between the largest manufacturing interests, but a number of small establishments in Indiana were causing demoralization in lime glass chimneys, or the cheap grade of goods. During the census year the tank furnace became a factor in the manufacture of the common lime glass chimneys, 4 tanks being reported. Great strides had also been taken toward improved factory equipment for handling the ware; lehrs operated by electricity, electric conveyors to take the ware from the lehr to the packer and then to the stock room or car, were among the improvements made, together with a great increase in the rapidity of the finishing operation. A good export trade has been developed in this branch of the industry. Large shipments have been made for many years by export houses, but during the census year the manufacturers renewed attempts to reach the export trade direct, and a special effort to introduce the American lamp chimney into England was successful, 66,667 dozen chimneys being reported as sent direct from factory to England during the year. The remainder of the exports that were shipped direct from the factories were sent to South America and Mexico.

Lantern globes were manufactured during the census year in 6 states by 27 establishments, and the number reported was 1,044,816 dozens, valued at $497,021, or 2.9 per cent of the total value of all pressed and blown ware manufactured. The average value per dozen was 48 cents, the average value by states ranging from 25 cents to $1.17 per dozen, depending upon the quality of the ware. There were two establishments employed exclusively in the manufacture of lantern globes, one in Indiana and one in West Virginia. The percentages of the product manufactured in the leading states, of the total for the United States, are as follows: Indiana, 52.4 per cent of the quantity and 35.4 per cent of the value, with an average value per dozen of 32 cents; New York, 15.5 per cent of the quantity and 38.2 per cent of the value, with an average value per dozen of $1.17; Ohio, 13.7 per cent of the quantity and 14 per cent of the value, with an average value per dozen of 49 cents; West Virginia, 12.6 per cent of the quantity and 6.6 per cent of the value, with an average value per dozen of 25 cents; Pennsylvania, 5.6 per cent of the quantity and 5.4 per cent of the value, with an average value per dozen of 46 cents. A small proportion was manufactured also in Massachusetts. Indiana and West Virginia supplied the great bulk of the output of cheap lantern globes, while New York led in the manufacture of ware of a higher grade. There were no statistics of the manufacture published at the census of 1890, but a great increase has been made during the decade. During the census year very active competition on the cheaper grades of lantern globes was developed. More than 10,000 dozen lantern globes were reported in 1900 as exported direct from the factories to Mexico and Central America; this represented but a small part of the total exportation.

The manufacture of pressed and blown shades, globes, electric bulbs, and glassware for gas and electric lighting ranked third in value of products in the pressed and blown ware branch of the industry in 1900, being 14.6 per cent of the total. The shades and globes ranged in quality from the plain pressed Welsbach gas article to the most costly and artistic products in fine plain and colored glass, richly decorated, engraved, or etched. The manufacture of glassware for the Welsbach gas light had developed to a very large extent. Electric glassware, such as incandescent bulbs and arc globes, formed a large item, although foreign competition in that line was quite active. The manufacture of gas and electric glassware has been largely a development of the last decade, and it is now one of the specialized lines of the industry. Although the increased use of gas and electricity has curtailed the use of the oil lamp in some quarters, yet a tendency has been shown toward the use of fancy lamps with highly decorated or ornamented shades and globes, more for decorative effect, probably, than real use, and this has greatly stimulated the production of globes and shades of a much higher quality in general than was ever before manufactured. The total production of shades, globes, and gas and electric goods in 1900 was manufactured in 7 states, from 3 of which, Pennsylvania, New York, and Ohio, 94.9 per cent of the total value was reported. There were 30 establishments engaged in the manufacture of these goods on a more or less extensive scale. The average value per dozen for the United States was 93 cents, the average value by states varying as the bulk of the output was cheap gas and electric ware or decorated shades and globes.

From Pennsylvania was reported 32 per cent of the total quantity and 58.1 per cent of the total value, the average value per dozen being $1.70. Large quantities of medium-priced globes and shades, cheap gas goods, and a valuable production of globes and shades of the finest quality were manufactured in that state. In New York a large quantity of high-grade shades and globes, and a large output of electric bulbs were manufactured. The quantity of articles of this class manufactured was 11.7 per cent of the total, and the value 20.8 per cent, with an average value per dozen of $1.66. A large number of electric bulbs was manufactured in Ohio, which was third in rank as to value of products, but was far in the lead as to quantity, with 52.3 per cent of the total quantity reported and 16 per cent of the total value, the average value per dozen for the state being 28 cents. Shades, globes, and gas and electric goods were manufactured also in West Virginia, Massachusetts, Indiana, and New Jersey. Decorated shades and globes constituted the larger part of the product in West Virginia, and the product in Indiana was electric and gas ware, at an average value of 13 cents a dozen. Shades and globes were manufactured in Massachusetts, and in New Jersey the product was entirely electric bulbs. Great improvements have been made in the last few years in the package for shades and globes, nearly all the better grade being packed in separate cartons. The export trade has had a steady growth, but complete statistics were not obtained from the factories. A total of 44,200 dozen articles in this branch of the industry, mostly electric ware, was reported in 1900 as shipped direct from the factories to Canada, the West Indies, South America, and Australia. By far the largest proportion was exported to Canada.

Blown tumblers, stemware, and bar glasses, 6,127,367 dozen in number, were reported in 1900 by 17 establishments in 4 states. These products constituted 9.4 per cent of the value of all pressed and blown ware manufactured. The average value per dozen for the United States was 26 cents. The manufacture of this class of ware has become greatly concentrated, 94.3 per cent of the total value of products being reported from Pennsylvania and West Virginia. The percentages of the total quantity and total value manufactured in the two leading states are as follows: Pennsylvania, 57.3 per cent of the quantity and 69.3 per cent of the value, with an average value of 31 cents per dozen; West Virginia, 37.4 per cent of the quantity and 25 per cent of the value, with an average value of 17 cents per dozen. The remainder of the product was manufactured in Ohio and Indiana, the average value per dozen in Ohio being 25 cents, and in Indiana, 34 cents. The returns do not embrace the total production of blown tumblers, as many were reported under "cut glass," having received light cutting. A large proportion of the lower grade of blown tumblers manufactured in Pennsylvania was made on the blowing machine, but practically all the finer grades were made by hand. Great improvements in the finishing of this class of ware have been made in the last few years, and much of the "cracking-off" is done by a machine on which a gas jet is used in place of a wire, one machine, operated by a boy, having a capacity of 9,000 tumblers a day. Improvements in grinding machinery have made it possible for two girls with one machine to grind 22,500 dozen tumblers in a week. For a long period blown tumblers, stemware, and bar goods have formed a large item in glass exports, being shipped to the principal countries of the world in steadily increasing quantities.

Decorated opal or porcelain glassware was very much in favor with the public during the closing years of the last decade. It was made into small-piece sets, in an endless variety of novelties and toilet articles. In 1900 the manufacture of 3,750,443 dozen pieces was reported, representing 9.3 per cent of the total value of pressed and blown glassware manufactured. In large part the decorations were of the cheapest kind, the average price per dozen for the United States being 42 cents. Twenty-six establishments in 6 states reported its manufacture, and 90.7 per cent of the total value of the products was made in Pennsylvania and West Virginia. Establishments in Pennsylvania made 78 per cent of the total quantity and 76.8 per cent of the total value, and in West Virginia 12.8 per cent of the total quantity and 13.9 per cent of the total value. Establishments in Indiana, Ohio, Massachusetts, and New York were engaged also in manufacturing this class of ware. The great demand for decorated opal or porcelain glassware developed within the last half of the decade, and in 1900 its manufacture formed a prominent part in the operations of some of the largest pressed ware establishments in the country, leading to a large increase in the decorating facilities of those plants. The craze for opal ware was decreasing at the close of the census year and the production gave evidence of soon returning to normal proportions.

Cut glassware, 134,726 dozen pieces in number, valued at $672,463, an average of $4.99 a dozen, was reported by 12 establishments in 1900. This report does not cover the numerous glass-cutting establishments in which the basic material used is the glass blank and in which the manufacture consists merely in reworking the glass. A large portion of the cut glass reported from Pennsylvania and West Virginia was light-cut articles, such as tumblers, although there was 1 establishment in Pennsylvania engaged largely in the manufacture of cut ware of the highest grade. The percentages of the total quantity and total value manufactured in the several states are as follows: Pennsylvania, 42.2 per cent of the total quantity and 46.3 per cent of the total value, at an average value of $5.48 per dozen pieces; Massachusetts, only 2.5 per cent of the total quantity but 21.8 per cent of the total value, the average value of $44 per dozen indicating the manufacture of the richest cut ware; the same is true of Ohio, with only 2.2 per cent of the total quantity and 18.7 per cent of the total value, an average value per dozen of $43.45. In West Virginia, with its large production of blown ware, practically all light cutting was done, the product averaging $1.23 per dozen in value; the product of that state was 23 per cent of the total quantity, but only 13.1 per cent of the total value.

West Virginia was first in the number of pieces manufactured, although its product was practically all of the cheapest kind. A small product was also reported from Indiana. The largest part of the cut glass manufactured was made in establishments in which the glass was reworked only, and is not included in this report. A list of such establishments, published at the close of the census year, giving the number in each state, was as follows: New York, 21; Pennsylvania, 13; Illinois, 4; Connecticut, 2; and Massachusetts, Rhode Island, New Jersey, West Virginia, and Michigan, 1 each. The industry has had a large growth in the last decade, particularly during the latter part of it, the number of establishments having doubled and the number of frames operated more than trebled. The demand has steadily increased and the market widened as prices have been lowered by competition. The popularity of pressed ware in imitation of cut ware shows the widespread desire for the real cut article. An improvement that will probably be made in the industry is the manufacture of the blank by pressing, increasing the speed of manufacture fourfold over the blowing process. It was for a long time the practice to import the blanks from France for most of the finest grade of ware cut in this country, but the domestic blank is now conceded by competent judges to be equal, if not superior, and is steadily supplanting the imported article. The superiority of American rich cut glass is generally acknowledged at home and abroad.

The amount reported as the value of all other pressed and blown ware products, $1,384,945, includes a large variety of articles for different purposes. One item that has come into prominence during the last few years is the manufacture of prismatic glass for increasing the diffusion of sunlight in buildings. The product of the only establishment manufacturing glass play marbles in the United States, located in Ohio, is included in this total.

The value of all products other than glass reported by establishments manufacturing pressed and blown ware and bottles and jars was $690,562, a large item being packages, particularly for lamp chimneys. According to some manufacturers, the profit in certain lines of chimneys lies entirely in the sale of the package.

MATERIALS.

Table 10 is a comparative summary of the quantity and cost of the materials used, with percentages of in crease, for 1890 and 1900.

TABLE 10.—QUANTITY AND COST OF MATERIALS USED, 1890 AND 1900, WITH PER CENT OF INCREASE.

	1900	1890	Increase.	Per cent of increase.
Total cost	$16,731,009	$12,140,985	$4,590,024	37.8
Glass sand, tons	581,720	369,328	212,392	57.5
Cost	$846,822	$899,998	[1]$53,176	[1]5.9
Soda ash, tons	157,779	96,777	61,002	63.0
Cost	$2,259,939	$3,108,233	[1]$848,294	[1]27.3
Salt cake, tons	53,257	38,092	15,165	39.8
Cost	$518,590	$604,179	[1]$85,589	[1]14.2
Nitrate of soda, ons	10,770	7,031	3,739	53.2
Cost	$320,937	$278,291	$42,646	15.3

[1] Decrease.

TABLE 10.—QUANTITY AND COST OF MATERIALS USED, 1890 AND 1900, WITH PER CENT OF INCREASE—Con.

	1900	1890	Increase.	Per cent of increase.
Limestone, tons	91,015	45,482	45,533	100.1
Cost	$181,717	$136,450	$45,267	33.2
Lime, hundredweights	794,679	743,765	50,914	6.8
Cost	$147,901	$150,092	[1]$2,191	[1]1.5
Arsenic, pounds	2,349,261	1,823,007	526,254	28.9
Cost	$112,630	$61,575	$51,055	82.9
Manganese, pounds	1,493,538	610,915	882,623	144.5
Cost	$57,493	$31,080	$26,413	85.0
Litharge, pounds	8,386,106	5,501,559	2,884,547	52.4
Cost	$490,200	$300,096	$190,104	63.3
Potash or pearlash, pounds	4,406,211	2,544,978	1,861,233	73.1
Cost	$186,847	$135,047	$51,800	38.4
Grinding sand, tons	265,438	227,416	38,022	16.7
Cost	$166,040	$151,995	$14,045	9.2
Fire clay or pot clay, pounds	32,151,017	37,066,652	[1]4,915,635	[1]13.3
Cost	$221,183	$328,903	[1]$107,720	[1]32.8
Pots, not including those m de at works, number	8,941	8,006	935	11.7
Cost	$381,147	$393,875	[1]$12,728	[1]3.2
Fuel, cost	$3,203,146	$2,340,912	$862,234	36.8
Packages and packing materials, cost	$4,913,544	$1,853,462	$3,060,082	165.1
All other materials, cost	$2,722,873	$1,366,797	$1,356,076	99.2

[1] Decrease.

The cost of materials used in the combined industry of glass manufacture in 1900 was 37.8 per cent greater than in 1890. In nearly all the principal materials, a comparison of returns for 1900 with those for 1890 shows a large increase in the quantity used and a decided decrease in the average cost per unit, notwithstanding the fact that in 1900 the prices of practically all glass-making materials were sharply advanced. An increase of 57.5 per cent is shown in the total number of tons of glass-melting sand reported used in 1900 over 1890, 581,720 tons being reported in 1900 and 369,328 in 1890. On the other hand, a decrease of 5.9 per cent in total cost is shown in 1900 from 1890, the total cost in 1890 being $899,998, while in 1900 the total cost was $846,822. The average cost per ton in 1900 was $1.46 compared with $2.44 in 1890. Glass sand of very fine quality in practically inexhaustible supplies, is found in many parts of the country, although the chief sources of supply are still, as they have been for many years, the Juniata Valley in Pennsylvania; Hancock county, West Virginia; the Fox River district in Illinois; and St. Charles, St. Louis, and Jefferson counties in Missouri. By far the largest proportion of the glass sand used comes from these deposits, although southern New Jersey still furnishes sand for a number of factories in the East, and sand of the finest quality still comes from Berkshire, Mass. The cost of transportation and the fine quality of more available deposits have considerably restricted the output from the latter locality. During the census year a considerable quantity of good glass sand came from Westmoreland county, Pennsylvania.

The preparation of sand for the glass factories became a highly specialized business during the last decade, about a score of establishments being exclusively engaged in the industry, with elaborately equipped plants representing large investments. The active competition which developed among these establishments is principally accountable for the large decrease in price in 1900 compared with 1890. Eight establishments in the Juniata Valley were merged under one head during the census year and prices on all grades of sand were sharply raised. Many glass manufacturers, however, had contracted for their supply for the season during the period of low prices, and, in addition, two of the largest manufacturing interests were mining and preparing their own sand to a large extent, making it cost them considerably below the average. Competition has led to the greatest care and attention in the preparation of the glass sand and the maintenance of a high quality.

The supply of soda ash for glass manufacture formerly came almost entirely from England; but during the last decade, through the development of the Solvay process, practically all soda ash used in glass making was of domestic manufacture, coming mainly from Syracuse, N. Y., and near Detroit, Mich. A large plant was projected during the census year at Barberton, Ohio, by glass manufacturing interests. One of the greatest advances in the domestic manufacture of soda ash was the establishment during the decade of large works at Wyandotte, Mich., by glass manufacturers to directly supply their wants. The number of tons of soda ash reported in 1900 was 157,779, compared with 96,777 tons in 1890, an increase of 63 per cent, while the total cost in 1900 was $2,259,939, compared with $3,108,233 in 1890, a decrease of 27.3 per cent. The average cost per ton in 1900 was $14.32, compared with $32.12 in 1890. The demand for soda ash in 1900 was unusually large, exhausting the domestic supply and greatly increasing importations. This abnormal demand came from outside the glass industry, the textile industry using a large quantity, and is shown by the large increase of importations in 1900 over 1899. As reported by the Bureau of Statistics of the Treasury Department, imports entered for consumption were 80,118,967 pounds, valued at $665,104, in 1900, compared with 41,844,101 pounds, valued at $304,549, in 1899.

The salt cake used in glass making twenty years ago was nearly all imported, but the greater portion of the amount consumed in the census year was of domestic manufacture, many large chemical manufacturers furnishing it, to the almost total exclusion of the foreign product. Competition has lowered the average cost per ton 38.6 per cent from 1890 to 1900, the average cost per ton for the respective years being $15.86 and $9.74. The number of tons used in 1890 was 38,092, costing $604,179, compared with 53,257 tons in 1900, costing $518,590, an increase in quantity of 39.8 per cent and a decrease in cost of 14.2 per cent.

Practically the entire supply of nitrate of soda used in glass manufacture in the United States comes from South America. The number of tons used in 1890 was 7,031, costing $278,291, compared with 10,770 tons in 1900, costing $320,937, an increase in quantity of 53.2 per cent and in cost of 15.3 per cent. In 1890 the average price per ton was $39.58, compared with $29.80 in 1900.

The number of tons of limestone used in glass manufacture in 1900 was 91,015, costing $181,717, or an average of $2 per ton, compared with 45,482 tons in 1890, costing $136,450, or an average cost of $3 per ton. The increase in the quantity used in 1900 over 1890 was 100.1 per cent, and in cost 33.2 per cent. Ohio and Indiana were the principal sources of supply.

The quantity of lime used in 1900 was 794,679 hundredweight, costing $147,901, compared with 743,765 hundredweight in 1890, costing $150,092, an increase in 1900 over 1890 of 6.8 per cent in quantity and 1.5 per cent in cost. The average cost per hundredweight in 1890 was 20.2 cents, and in 1900 was 18.5 cents. Much of the lime is wood-burned and ground and bolted, the industry being highly developed in Seneca county, Ohio, and vicinity.

England has been the chief source of the supply of arsenic used in glass manufacture. Recently, however, the imports from that country have been greatly reduced by the supply from the gold fields of British Columbia. At the close of the census year, movements were in progress which promised to result in the development of the manufacture in this country, and it is confidently asserted that in a few years the glass industry will be supplied entirely by arsenic of domestic manufacture. In 1890, 1,823,007 pounds were reported, costing $61,575, and in 1900, 2,349,261 pounds, costing $112,630, an increase of 28.9 per cent in the quantity and 82.9 per cent in the cost.

Manganese, which comes largely from Saxony, was used in 1890 in glass making to the extent of 610,915 pounds, costing $31,080, compared with 1,493,538 pounds in 1900, costing $57,493, an increase in quantity of 144.5 per cent and in cost of 85 per cent. The average price per pound was 5.1 cents in 1890 and 3.2 cents in 1900.

The proportion of litharge manufactured in the United States for use in glass manufacture is steadily increasing, but a large proportion is still imported from England. The quantity used in 1890 was 5,501,559 pounds, costing $300,096, compared with 8,386,106 in 1900, costing $490,200, an increase in quantity of 52.4 per cent and in cost of 63.3 per cent. The average cost per pound in 1890 was 5.5 cents and in 1900 was 5.8 cents.

There were 2,544,978 pounds of potash or pearlash, which was supplied principally from Germany, used in 1890, costing $135,047, compared with 4,406,211 pounds in 1900, costing $186,847, an increase in quantity of 73.1 per cent and in cost of 38.4 per cent. The average cost per pound in 1890 was 5.3 cents and in 1900 was 4.2 cents.

A notable increase is shown in the consumption of packages and packing materials in 1900 over 1890. The cost of such materials in 1890 was $1,853,462 compared with $4,913,544 in 1900, an increase of 165.1 per cent. The neatness of the package received special attention during the latter part of the decade, and great improvement has resulted, compared with the practice followed formerly.

IMPORTS AND EXPORTS OF GLASS.

Table 11 presents the value of the different kinds of glass imported and exported from 1869 to 1900, inclusive.

TABLE 11.—VALUE OF GLASS IMPORTED AND EXPORTED: 1869 TO 1900.[1]

YEAR.	IMPORTS.										EXPORTS.		
	Total value.	Bottles, vials, carboys, etc.[2]	Cylinder and common window glass, unpolished.	Cylinder and crown glass, polished.		Plate glass.			Glass plates or disks for optical instruments.[4]	All other.	Total value.	Window glass.[5]	All other.
				Unsilvered.	Silvered.[3]	Fluted, rolled, or rough.	Cast, polished, unsilvered.	Cast, polished, silvered.					
1900	$5,037,931	$464,483	$1,555,924	$539,082	$286	$7,915	$226,295	$12,413	$125,449	$2,106,084	$1,936,119	$36,218	$1,899,901

1 Reports of United States Treasury, Bureau of Statistics.
2 Included in "all other" glass and glassware imported previous to 1884.
3 Included in "unsilvered cylinder and crown glass, polished" previous to 1885.
4 Not separately reported previous to 1886.
5 Included in "all other" glass and glassware exported previous to 1884.

The import figures presented in Table 11 for "cylinder and crown glass, polished," and plate glass, silvered and unsilvered, show the great victory the American manufacturers of polished plate glass have gained in superseding the foreign article, particularly the foreign mirror plate, by glass of domestic manufacture. The silvered, polished crown glass is styled German looking-glass plate, while the silvered polished plate glass is what is commonly known as French mirror plate. The German plate is lighter and inferior to the French plate and is nearly all imported under 5 square feet in dimensions, while the French plate is of larger sizes. From 1869 to 1889, inclusive, the value of importations of French mirror plate was nearly equal to the imports of polished plate glass unsilvered, the aggregate value of the French mirror plate during the twenty-one years being $20,557,075 while the value of the unsilvered polished plate was $22,901,144. Previous to 1885 the importations of the German mirror plate are included in the table with the unsilvered polished cylinder and crown glass, the larger part of the polished cylinder and crown imported to that date being employed for car windows and similar uses where a glass thinner than ordinary plate and of better quality than common window glass was desired. The importations of silvered German mirror plate previous to 1889 were inconsiderable, but in that year their value increased from $59,208 in 1888 to $756,577, or 1,177.8 per cent.

The year 1889 marked the beginning of the decline of the importations of French mirror plate and the growth of the importations of German plate. The value of imported French silvered plate in 1890 was only $249,819, a decrease of 79.9 per cent from the previous year; this was due in part to the introduction of American plate, but more to the remarkable increase in importations of the cheaper German plate.

The value of the German silvered plate imported in the same year increased $772,824, or 102.2 per cent over 1889. For the next seven years, German silvered plate importations exceeded in value the combined value of silvered and unsilvered polished or French plate. The plate glass manufacturers of the United States during this time were directing their competition against the more profitable field filled by the French silvered and unsilvered plate, so that the German plate had nearly a clear field. However, an increase of plate glass productive capacity in the United States in 1894 produced a period of low prices that caused large reductions in the value and number of square feet of all foreign plate imports, reducing the value of imported French mirror plate 51.4 per cent from 1893 to 1894; German silvered plate 53.2 per cent; polished plate and rough plate, each 45.4 per cent; and unsilvered polished cylinder and crown glass 75.6 per cent. From this period of low prices a better organization of the American plate glass manufacture developed, a consolidation of individual companies controlling a large percentage of the capacity being formed; and the fight against foreign glass was carried on so successfully that from 1894 French mirror imports have dwindled to insignificant proportions, being, in 1900, 83.5 per cent less than in 1894 and 95 per cent less than in 1890. During 1895 and 1896 imports of polished plate, unsilvered, increased to some extent, caused largely by the sale in the United States at low prices of surplus foreign stock. After 1896, however, the American manufacturing interests lined up more closely against the foreign trade, and since then the value of imported polished plate has been gratifyingly small, showing in 1900 a decrease of 70.4 per cent from 1896 and 79.8 per cent under the total value of 1890.

While German mirror import values received a decided check in 1894 and 1895, the next two years witnessed a revival and a change in the form of importation, an increased quantity being imported unsilvered, to be silvered by American mirror makers. Table 11 shows a marked decrease in the value of silvered German plate imports in 1897 and a considerable increase in the unsilvered imports. American competition has made it advantageous to have the silvering done in this country. With French mirror plate practically excluded, the plate-glass manufacturers of the United States took up the German mirror plate problem, and by selling superior polished plate to the mirror trade at cost, or less, reduced the value of German plate imports, unsilvered and silvered, nearly one-half in 1897, and at present have stopped the importation of the German silvered plate even more completely than they have the French product. In 1900 practically all the German plate was imported unsilvered, and was much less than the total quantity, silvered and unsilvered, annually imported from 1890 to 1897.

A portion of the imported polished cylinder and crown glass comes in competition with domestic window glass for car windows, but the expected development of the manufacture of thin polished plate glass in this country may probably supplant the foreign article for high-quality and light-weight glazing purposes. Ninety-five and five-tenths per cent of the total quantity of unsilvered polished cylinder and crown glass imported in 1900 was shipped from Germany, the remainder being divided among Austria-Hungary, Belgium, France, Netherlands, and the United Kingdom. Of the total quantity of fluted, rolled, and rough plate imported in 1900, the United Kingdom supplied 91.3 per cent and France, Belgium, and Germany, the remainder. The importation of polished plate glass is controlled by an European syndicate, and is apportioned among the various producing countries; Belgium furnishing, in 1900, 80.2 per cent of the total quantity; Germany, 8.1 per cent; and the United Kingdom and France, practically all the remainder. The extent of the importation is determined largely by trade conditions abroad, this market being used for the disposal of surplus products, with slight regard to price. New York is the principal port of entry for plate glass.

The value of importations of fluted, rolled, and rough plate has steadily decreased, being, in 1900, 90.7 per cent less than in 1890. The total value of such imports in 1900 was nearly equaled by the direct export shipments of one American skylight factory.

Window glass importation values have maintained comparative regularity during the last thirty years. The total value of window glass imported during the decade ending with 1880 was $14,993,860; from 1880 to 1890, $15,686,308; and from 1890 to 1900 the value was $12,583,779. While the total value of window glass imported during the last decade was less than that of each of the two preceding decades, the value in 1900 exceeded that in 1890 by 6.4 per cent; 1880 by 8.1 per cent; and 1870, by 6.6 per cent. The number of pounds imported in 1900, as reported by the United States Treasury Bureau of Statistics, was 51,343,339, which, estimating 70 pounds to the 50-foot box, 25 per cent double strength, equals 733,476 boxes, or 16.9 per cent of the quantity manufactured in the United States in that year. The number of pounds imported during each of the preceding ten years was as follows: 1899, 47,202,267; 1898, 38,908,992; 1897, 55,961,813; 1896, 53,182,301; 1895, 40,786,279; 1894, 52,437,068; 1893, 63,715,989; 1892, 72,682,127; 1891, 58,932,738; 1890, 73,112,550. The imports, 92.7 per cent of which come from Belgium and the remainder from the United Kingdom, Germany, and France, are regulated largely, as in plate glass, by the condition of the foreign market. The Continental and far Eastern markets are the most profitable fields for Belgian window glass, and if the demand in these markets is weak and a surplus stock accumulates in Belgium, increased shipments to the United States follow. Belgian glass, the product of cheaper labor, constantly acts as a check on window-glass prices in the United States, for unless the demand abroad is unusually strong, the first announcement of high prices in this country results in an increase of exports. The foreign window glass, as in the case of plate glass, was for a long time credited with superior quality, especially as to finish, but in both cases that claim has been disproven in the progress of the American plate and window glass manufacture during the last decade. In 1900 Boston, Mass., was the principal entry port for foreign window glass, followed by New York, N. Y. The entry ports for the South are St. Louis, Mo.; Baltimore, Md.; Newport News, Va.; and New Orleans, La. Previous to 1901 most of the window glass used on the Pacific coast was of foreign manufacture, entering principally at San Francisco. The cheapness of ballast freight rates of wheat-carrying ships returning to the Pacific coast, compared with the expensive overland freight rates from the domestic window-glass factories, gave the foreign glass a great advantage, but American manufacturers, by a decided differential in price and systematic distributing arrangements, have succeeded lately in steadily reducing the importations to that section of the country.

The value of imports of bottles, vials, carboys, etc., has shown an almost constant decrease from year to year during the last ten years. The total value in 1900 was $464,483, or 49.1 per cent less than in 1890. About one-half of the total importation consists of bottles filled with liquors, mineral waters, etc., and the principal exporting countries are Germany, France, Austria-Hungary, and the United Kingdom, in the order named. The importation of empty bottles, therefore, is very small in comparison with the domestic output. New York and Baltimore are the chief entry ports, but many unfilled bottles enter at San Francisco, coming over at cheap rates in returning wheat-carrying ships. Boston, New Orleans, and Philadelphia, also have large receipts.

The importation of optical glass has steadily increased, the development of the photographic camera being a strong stimulant. A large portion of the total importation enters in the New York camera district at Rochester, N. Y. Germany furnished 43.7 per cent of the total value in 1900; the United Kingdom, 33.7 per cent; and France, 22.6 per cent. Attempts have been made in this country to make optical glass, but the manufacture has never passed beyond the experimental stage, and at present even experimenting has ceased. The time and care required and the uncertainty as to results attending every melt, in face of the free entry of these products from countries long skilled in the art, make the manufacture of optical glass an unattractive proposition to glass manufacturers in the United States.

A large proportion of the $2,106,084 reported as the value of "all other" glass imports in 1900, was that of fancy decorated Bohemian glassware, much of it made to sell at low prices. The fancy colored and decorated ware, of the Bohemian order, is as yet but a small item in glass manufacture in the United States, although a large quantity is purchased. Increased attention is being given to it, and such success was achieved in its manufacture during the census year by at least one firm, that it will very likely have a vigorous growth during the next few years. Decorated opal or porcelain glass has met with great favor in this country for several years, and in addition to the large quantity of home manufacture, a considerable quantity has been imported, mostly from Germany. Germany has a large trade in chemical glassware for laboratory use, and, with England and France, is finding a rich and almost undisputed field here for that class of ware. The manufacture of chemical ware has been carried on in the United States in a small way, but a recent movement among American chemists in favor of home manufacture has caused more or less agitation among glass manufacturers, and gives promise of leading to a determined attempt on the part of one or two firms, to establish the industry on a larger scale in this country.

Great progress has been made in recent years in the manufacture of expensive "art glass" of the highest order. One of the exhibits which attracted considerable attention from glass men of all countries at the Paris Exposition was a new art glass manufactured by a firm in New York city. High-grade lamps, unsurpassed by any manufactured, have been produced in this country. Watch crystals, which are not manufactured in the United States, although it was attempted recently in West Virginia, are imported in large numbers of small aggregate value. The process of manufacture is simple, and it will in time probably form a part of the American industry. A thin round ball or bubble of glass is blown, and from this, with diamond-pointed compasses, the circular disks are cut, which are then placed on properly shaped blocks and bent to the required shape by reheating. Of the total value of "all other" glass imports, 33 per cent comes from Germany, 28.1 per cent from Austria-Hungary, 23.1 per cent from France, 7.8 per cent from the United Kingdom, and 6.3 per cent from Belgium.

Table 11 presents, in addition to the value of imported glass, the value of glass of domestic manufacture exported annually, from 1869 to 1900, inclusive.

The exportation of all other than window glass has almost constantly increased from year to year since 1869, gaining 227.2 per cent in value during that period, and 117.4 per cent during the last decade. The gain in the ten years ending with 1890 over the ten preceding years was $1,830,612, and between 1890 and 1900 over the ten preceding years, $2,922,065. American glassware is exported to nearly every civilized country, 68 countries being reported by the Bureau of Statistics of the Treasury Department in 1900. Canada received 30 per cent of the total value in 1900; Mexico, 14.6 per cent; Australia, 12.8 per cent; Cuba, 8.2 per cent;

and the United Kingdom, 7.3 per cent. An inquiry as to exports was incorporated in the schedule used for the purpose of eliciting complete information as to the articles exported and their destinations; but as the largest part of the exporting is done through regular exporting houses, a very small portion goes direct from the factory with its destination known. The returns from factories, therefore, are very meager, but as far as they go, furnish an idea of the comprehensive scope of the glass export business. Beer and soda bottles, and plain and lettered prescription bottles, pressed tableware, lamp chimneys, and lantern globes constitute the bulk of the exports reported direct from factories. Bottles to the value of $161,300 were reported as exported during the census year by 12 firms, $66,333 of which was the value of beer and soda-water bottles exported to Mexico, where a fair trade has been developed recently in that line of ware. Plain and lettered prescription bottles are a large item in the exports, and 6 firms reported direct shipments to Canada, South and Central America, Mexico, West Indies, Great Britain, France, East Indies, Australia, China, and Japan. The bottle trade with the Philippines and Cuba is very large, principally in the form of bottles filled with beer and liquor. Direct tableware exports were reported by 16 establishments, amounting to $137,982.

American pressed tableware is unexcelled in the markets of the world for color, workmanship, and finish, which make it the closest imitation of real cut ware, at such prices as, quality considered, place it in a class by itself. Export trade is receiving special consideration from some of the largest manufacturers of pressed ware, and the American sample room and traveling agent for pressed glassware are becoming more general abroad. The largest part of the lamp chimney exportation is done by jobbing houses, yet 4 factories reported direct shipments valued at $111,560. About four-fifths of the quantity reported went to South America, where lamp chimneys made in the United States are in high favor. As a result of a recent systematic introduction of the American lamp chimney in England and some of the continental countries, the exports in that direction are steadily increasing and have already reached a very satisfactory figure. American lantern globes are largely used in Central and South America. Canada, South America, and Australia are steadily increasing their consumption of American gas and electric glassware, such as globes and shades. Cathedral or opalescent glass valued at $13,432 was reported as shipped direct from factory to Canada, Germany, England, and France, where, by reason of its superior colors and texture, it is preferred in the construction of art windows.

Exports of window glass show some increase during the last few years, but the lower cost of production in Belgium will, no doubt, continue to restrict, as in the past, the foreign trade of the United States in this commodity. The exports are confined largely to Mexico, British America, and the West Indies. A plan has been discussed to operate the American window factories an extra time during the year at reduced wages to manufacture glass for export exclusively, but it has not met with favor from the workmen and from some of the manufacturers.

FURNACE IMPROVEMENT.

The greatest advance made in the American glass industry in the past decade has been in the improvement of the melting furnace in the direction of greater economy and rapidity in operation. The great feature of this development has been the widespread substitution of the tank for the pot furnace, 48.8 per cent of the total melting capacity of active plants reported during the census year being contained in tank furnaces. In the United States the tank is practically a creation of the last ten years, its standing prior to that time being experimental, though it had been used successfully abroad for a much longer period. So far Germany and Belgium have set the pace for American glass furnace construction.

The glass-melting furnace is a modification of the reverberatory furnace, the materials to be melted being exposed to the action of the flame, but not to the contact of the burning fuel. While numerous modifications exist, the furnaces generally used are of two styles, the pot furnace and the tank furnace. The former is adapted either for the use of open pots or for covered pots, and the latter is either a day tank, intermittent in its melting action, or a continuous tank in which the melting is continuous. The pot furnace contains a number of melting pots, large clay crucibles, each holding, on an average, a ton of molten glass. These pots are arranged immediately inside the breast wall of the furnace with room in the center of the furnace for combustion space. The batch, or mixture of the raw materials, is filled into these pots through an opening in the side of the furnace opposite each pot, and after the melting process is completed, the glass is gathered from the pots through these openings. The pot furnace used in the manufacture of plate glass is an exception in this respect, as the pots are removed bodily from the furnace by a crane and their contents poured on the casting table. In the tank furnace, pots are entirely dispensed with, the glass being melted and held on the hearth of the furnace itself, the flame sweeping across its surface. In the continuous tank there is a supply of molten glass at all times, the batch being filled in at one end and the glass worked out continuously at the other end. The day tank requires a night or day to melt the glass, when it is worked out and the tank again filled with the batch, the operation being similar to the working of a pot furnace. The pot furnaces used in the manufacture of window glass, plate glass, and bottles and jars are either square or oblong in form, and those for flint glass, tableware, etc., are round or oval.

The open-pot furnace for window glass and bottles and jars varies in length according to the number of pots used, its width being about three times the diameter of the pot. The pots vary in number from 4 to 12, generally being 6 or 10, placed in the furnace in 2 rows. Openings at the ends of the furnace permit the removal and replacement of broken pots. The crown of the furnace, forming the top of the combustion chamber, is preferably rather flat, but set high enough to allow adequate flame development and good distribution of the heat between and above the pots. In the direct-fired furnace, the fuel is on a grate set in the space between the 2 rows of pots, somewhat below the level of the bench on which the pots are placed. An arched passage—the cave—runs beneath the furnace for the admission of air to the grate, and there are frequently 2 caves crossing at right angles, so as to admit air from all directions. Neither flues nor regenerators are used when the fuel is fired direct, the draft being regulated by the height of the stack of the furnace, which varies with different fuels employed. In the regenerative gas-fired furnace, the regenerators are so placed that in the event of a pot breaking, the molten glass can not reach them and obstruct the draft. The hot escaping gases from combustion pass from the combustion chamber through the checkerwork of bricks, which take up their heat and soon become very hot. The direction of the flame is reversed and the air for combustion enters through the hot regenerator, while the waste gases pass out through another regenerator. By a reversal of the direction of the flame every twenty or thirty minutes, the hot outgoing waste gases are constantly giving off their heat to the regenerators and the incoming air is constantly returning it to the furnace. In what is styled a recuperative gas-fired furnace, no reversal of the current occurs. The waste gases pass out through a series of thin-walled flues, while the incoming air is admitted through a second series of thin-walled flues, and coming in contact with the first series of flues, absorbs the waste heat. In the gas-fired furnace the air and gas flues rise vertically at either end and terminate in ports at or below the hearth level. The flame traverses the furnace from one end to the other, describing the arc of a circle, or by lessening the draft, it can be made to completely fill the furnace. The open-pot furnace for plate glass is longer than that for window or bottle glass, as it usually holds 20 large pots. There is an opening in the wall of the furnace opposite each pot to allow its removal, bodily, for casting purposes. All plate-glass furnaces are gas fired, the air and gas flues ascending and terminating vertically or coming up vertically and turning so as to enter the furnace horizontally. With the use of the lehr in plate-glass manufacture, the tendency is now toward smaller pots, which increases the number that may be placed in the furnace.

The covered pot furnace for flint glass is generally circular in form. The pots have a hood-like top, which projects to the opening in the breast wall of the furnace and through which the batch is filled in and the glass worked out. This hooded top entirely shields the contents of the pot from the flame. When old or broken pots are to be replaced, the wall of the furnace is removed enough to allow for the passage of the pot. The average life of the covered pot is several months, while that of the open pot is about six weeks; the length of time, however, in each case, may be more or less. It is possible to melt a much better quality of glass in the covered pot than in the open pot, as the hooded top excludes many impurities caused by combustion. The number of covered pots in a furnace is from 8 to 16. In firing the open-pot furnace the aim is to develop in the combustion space between the pots and above them a solid flame, but with the covered pots, the flame must be divided so as to play close around each pot. To this end the flame is drawn from the center of the furnace to a series of flues at the breast wall, a flue being placed between each pot and the adjoining pot. The crown of the furnace comes just above the pots and the stack widens at the base sufficiently to take in the entire diameter of the furnace. The draft flues empty into the stack through the breast wall or through the crown. These furnaces are adapted for recuperative gas firing or direct coal firing. In the oval covered pot furnace the stack is at one side, as with the regenerative tank; greater economy of space in setting the pots is secured as well as better heating results. One method of treatment of the waste heat in a furnace of this kind is to convey it by a series of flues so as to heat the water system that heats the entire factory plant.

The first successful gas-fired glass-melting pot furnace was developed abroad in 1861, the solid fuel being converted into gas in a producer outside of the furnace. Several years were required to introduce this improvement into glass manufacture in this country. This application of gas is one of the chief improvements in modern glass making, making possible a saving in the cost of fuel of fully 50 per cent over the cost with the direct-fired furnace, greatly reducing the time of melt, improving the quality of the glass, and lengthening the life of the pot. However, the disadvantages attending the pot system of melting created a demand for a system to melt and blow the glass continuously; these disadvantages were the time lost with the pot system (fully one-half the time being spent in cooling and settling the metal, working out the glass, and reheating the furnace), and the constant loss incurred by breaking pots, one broken pot so disturbing the rest of the furnace that the full capacity is frequently unavailable for a considerable time. This led to the development of the tank furnace, which was used in Europe in 1861 and improved in 1872. However, the general introduction of the tank into glass manufacture in the United States did not occur until 1888, the successful operation of the continuous tank for window glass at Jeannette, Pa., in that year probably marking its actual introduction into the glass industry of this country. The chief advantages of the tank over the pot furnace are increased production, economy in operation, durability of furnace, regularity of working, and intensity of heat.

The day or intermittent tank is practically a pot furnace with one large open pot comprising the entire hearth, which is a square or oblong box built up of fire clay blocks and well ventilated on the bottom to prevent excessive wear and leakage occurring when the glass gets too hot or soft on the bottom. The air and gas are brought up through flues at one end and the products of combustion are discharged through flues at the other end. Either the regenerative or recuperative system can be used. There were 130 day tanks reported in operation during the census year, 117 of which were in establishments manufacturing bottles and jars and flint ware of all varieties, the average capacity of the tank in such establishments being 6 tons, equal to 6 pots; and 13 in establishments manufacturing skylight glass, glass tiling, rolled glass, and window glass. The greatest obstacle to the successful use of the day tank on flint glass has been the maintenance of color caused by the glass melting principally from the top, leaving the glass at the bottom of the tank less fluid and more refractory, but during the past decade this tank has been so improved that, at present, a very fair grade of so-called flint glass is in many cases being produced, at a great saving in cost over the pot-melting method. With these small tanks the use of gas for fuel probably produces the best results, but oil is being introduced for this purpose with a marked degree of success.[1]

The glass melting capacity of continuous tanks reported active in 1900 was 42.4 per cent of the total for the United States; pot furnaces with a total capacity of 4,300 pots were reported, day tanks of a capacity equivalent to 818 pots, and continuous tanks of a capacity equivalent to 3,775 pots, 2,476 of which were operated on bottles and jars and pressed and blown ware, and 1,299 on building glass. The continuous tank is confined largely to the manufacture of bottles and jars and window glass, 2 shifts being worked in the bottle trade and 3 in the window. The continuous regenerative melting tank contains an immense quantity of molten glass and is always full or nearly so. The window tank is oblong, four or five times as long as the width, with a capacity varying from 6 to 20 rings, each ring being equivalent to a capacity of 3 pots. The bottle tank is much shorter and wider than the window tank, and has an average of about 10 rings, each ring being equivalent to a capacity of 2 pots. The average window tank has 8 rings, or a capacity of 24 blowers or pots. Inside it is 14 feet wide, 70 feet long, and 5 feet deep, and will contain about 425 tons of molten metal. The batch is filled in continuously at one end and drawn, melting as it goes, to the working holes at the other end, where it is worked out. Near the working end of the tank is a floating bridge of prepared clay, extending down about one-fourth of the depth of the tank, which breaks the surface of the mass of glass and acts as a purifier, the completely melted glass passing beneath the floater into the working end of the tank, while the impure glass, which rises to the top, is held in check until properly melted. The wall of the working end of the tank is pierced by working holes through which the glass is gathered, in front of each hole being a deep clay ring stationed in the glass, the refined metal coming into this ring through the bottom and being gathered from the ring by the workman. The bottom and sides of the tank are well ventilated, to lessen the strain on the structure. The regenerators are at either side of the tank foundations, and the flues lead to ports in the side walls or to ports that open through the crown, the flame entering the furnace above the surface of the glass and just beneath the crown. All arrangements are made with a view to developing a nearly continuous sheet of flame.

A modification of the continuous tank for window glass, styled the blow-over tank, was introduced into this country in 1900, though in use abroad for a number of years. There were three or four such plants erected. By the use of the blow-over tank the blow furnace for "warming in" the roller of glass during the blowing operation is dispensed with, as the roller is "warmed in" directly over the mass of molten glass in the tank, the heat of the tank accomplishing this purpose, which effects a saving in fuel of about 50 per cent, for as much fuel is often required for the blow furnaces as for the melting tank. This improvement is made by lengthening the working end of the tank to permit a series of warming-in holes on each side between the floaters and the gathering holes. The results so far obtained with the blow-over tank will probably lead to its general introduction, as, in addition to the great saving in fuel cost, the heat is much more constant and uniform than with the blow furnace.

The use of oil as a fuel for glass melting has greatly increased during the last ten years. One of the most successful methods of oil firing is the use of the cheap, heavy oil of 34 to 40 specific gravity, practically a refinery by-product, with an air pressure of from 2 to 7 ounces per square inch. The air meets the flow of oil at the end of the burner and completely atomizes it in a spray, furnishing just enough oxygen to perfect combustion. Oil is advantageous as a clean fuel of high calorific value and perfect safety, but the cost restricts its general use. Benzine is largely used in certain

[1] Elements of Glass and Glass Making, Biser, 1900, page 62.

branches of the glass industry as fuel, being especially well adapted for fuel for glory holes, particularly in the manufacture of bottles, producing an intense uniform heat and requiring but little attention.

DETAILED STATISTICS OF GLASS MANUFACTURE.

The detailed statistics for the industry as reported are shown in Tables 12, 13, and 14; Table 12 presenting statistics of the entire industry; Table 13, of the manufacture of building glass; and Table 14, of the manufacture of pressed and blown glass, and bottles and jars. These tables present separate totals for each state in which there were 3 or more establishments, and group the statistics for other states, so as not to disclose the operations of individual establishments. The establishments are classified according to the character of the ownership, which shows that in the building glass branch of the industry, 6 were owned by individuals, 11 by partnerships, 102 by corporations, and 5 were of a miscellaneous character; and in the manufacture of pressed and blown glass, and bottles and jars, 23 were owned by individuals, 49 by partnerships, 157 by corporations, and 2 were of a miscellaneous character. The employees are classified so as to show for salaried officials, clerks, etc., and for wage-earners separately the number and salaries or wages of men, women, and children, respectively, and also the average number of wage-earners employed during each month of the year. Separate totals are shown for the different materials, presenting the quantity and cost of each; and the quantity and value of the several products manufactured, and the value of all other products, are given. The number of engines, water wheels, electric motors, and other forms of power in use, with their horsepower, are shown. The establishments are grouped in the tables according to the number of employees in each.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 229. WASHINGTON, D. C. July 3, 1902.

AGRICULTURE.

TEXAS.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

SIR: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the state of Texas, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land, under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It includes also the house in which the farmer resides, and all other buildings used by him in connection with his farming operations.

The farms of Texas, June 1, 1900, numbered 352,190, and were valued at $691,773,613. Of this amount, $100,222,811, or 14.5 per cent, represents the value of buildings, and $591,550,802, or 85.5 per cent, the value of the land and improvements other than buildings. On the same date the value of farm implements and machinery was $30,125,705, and of live stock, $240,576,955. These values, added to that of farms, give $962,476,273, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of all such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $239,823,244, of which amount $72,852,533, or 30.4 per cent, represents the value of animal products, and $166,970,711, or 69.6 per cent, the value of crops, including forest products cut or produced on farms. The "total value of farm products" for 1899 exceeds that for 1889 by $128,123,814, or 114.7 per cent, but a part of this gain is doubtless due to a more detailed enumeration in 1900 than in 1890.

The "gross farm income" is obtained by deducting the value of the products fed to live stock on the farms of the producers from the total value of farm products. In 1899 the reported value of products fed was $30,476,810, leaving $209,346,434 as the gross farm income for that year. The ratio which this amount bears to the "total value of farm property" is referred to in this bulletin as the "percentage of gross income upon investment." For Texas in 1899 it was 21.8 per cent.

As no reports for expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

Special reports as to the dimensions and cost of the leading irrigation ditches and canals, the area of land under them, methods for the artificial application of water to the growing crops, and other facts relating to irrigation were obtained by correspondence with farmers, engineers, and others. This correspondence was under the joint direction of Mr. F. H. Newell, chief hydrographer of the Geological Survey, acting as expert special agent for the division of agriculture, and Mr. Clarence J. Blanchard.

The statistics presented in this bulletin will be treated in greater detail in the report on agriculture in the United States. The present publication is designed to present a summarized advance statement for Texas.

Very respectfully,

L. G. Powers.
Chief Statistician for Agriculture.

AGRICULTURE IN TEXAS.

GENERAL STATISTICS.

Texas has a total land area of 262,290 square miles, or 167,865,600 acres, of which 125,807,017 acres, or 74.9 per cent, are included in farms.

The surface of Texas is greatly diversified. From the low, sandy Gulf coast rises a terrace of rich, rolling land, called the "prairie belt." Then comes a series of gradual elevations reaching to the plateau and mountains of the west and north, where some of the peaks attain an elevation of 5,000 feet.

There are a great many varieties of soil, nearly all excellently adapted to grazing. The prairies have in general a sandy loam, the interior, a heavier brown and black loam, while in the northern part of the state are great areas of red lands. In the waste portions are cacti and thorny mesquite chaparrals.

The Gulf of Mexico receives the drainage from the southern and central parts, while the Red and Arkansas rivers convey the waters of the northern part of the state to the Mississippi. In the south and east the rainfall is ample, but for the remainder of the state it is unreliable.

NUMBER AND SIZE OF FARMS.

The following table gives, by decades since 1850, the number of farms, the total and average acreage, and the per cent of farm land improved:

TABLE 1.—FARMS AND FARM ACREAGE: 1850 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	352,190	125,807,017	19,576,076	106,230,941	357.2	15.6
1890	228,126	51,406,937	20,746,215	30,660,722	225.3	40.4
1880	174,184	36,292,219	12,650,314	23,641,905	208.4	34.9
1870	61,125	18,396,523	2,964,836	15,431,687	301.0	16.1
1860	42,891	25,344,028	2,650,781	22,693,247	590.9	10.5
1850	12,198	11,496,339	643,976	10,852,363	942.5	5.6

The number of farms reported in 1900 was nearly thirty times as great as the number in 1850, and 54.4 per cent greater than in 1890. The total acreage of farm land has increased rapidly, being twice as great in 1900 as in 1890. The improved acreage shows a decrease of 5.6 per cent for the last decade, owing to the use of a more strict definition of the term "improved land" in 1900 than in 1890. The decrease in the percentage of farm land improved is due also to the acquisition of vast areas of new unimproved land for grazing purposes, resulting in a marked increase in the average size of farms. The increased acreages in crops indicate that there has been no actual loss of improved area.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1850.

TABLE 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND OF FARM PRODUCTS: 1850 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$962,476,273	$691,773,613	$30,125,705	$240,576,955	$239,823,244
1890	516,977,333	399,971,289	13,746,541	[3]103,259,503	111,699,430
1880	239,828,364	170,468,886	9,051,491	[3]60,307,987	65,204,329
1870[2]	100,971,937	60,149,950	3,396,793	37,425,194	[4]49,185,170
1860	137,186,219	88,101,320	6,259,452	42,825,447	....
1850	29,114,639	16,550,008	2,151,704	10,412,927	....

[1] For year preceding tbat designated.
[2] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other years they must be diminished one-fifth.
[3] Exclusive of live stock on ranges.
[4] Includes betterments and additions to live stock.

Every census year except the one following the Civil War shows a great growth in agriculture. The gain in the last decade in the total value of farm property was $445,498,940, or 86.2 per cent. The increase in the value of land, improvements, and buildings was $291,802,324, or 73.0 per cent; in that of live stock it was $137,317,452, or 133.0 per cent; and in that of implements and machinery, $16,379,164, or 119.2 per cent. The value of farm products in 1899 was more than twice as great as the value reported for 1889. A portion of this increase and of that shown for implements and machinery is doubtless the result of a more detailed enumeration in 1900 than in previous census years.

COUNTY STATISTICS.

Table 3 gives a statement of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS, AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH VALUE OF PRODUCTS OF 1899 NOT FED TO LIVE STOCK, AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Value of products not fed to live stock.	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.

[1] Includes some large live-stock ranches with portions of area in other counties.

In the majority of counties the number of farms increased in the last decade. The few counties reporting decreases are situated in the western part of the state. The total area of farm land decreased in but eleven counties, while most of the remaining counties report remarkable increases. The decrease in improved acreage shown in a large number of the counties is due to a more intensive cultivation of smaller farm areas and to the use of a more strict definition of the term "improved land" by the Twelfth than by any preceding census. The average size of farms for the state is 357.2 acres, and varies from 50.6 acres in Red River county to 450,000 acres in Parmer county. The large average areas of farms are, as a rule, in the western part of the state, in the counties containing large live-stock ranches.

For the state, the average value of farms, (including land, improvements, and buildings) was $1,964. Between 1890 and 1900 the value of farms decreased in but ten counties. With the exception of Atascosa, Calhoun, Hardeman, and Wilbarger, the value of implements and machinery increased in all counties, while Freestone and Limestone counties showed a decrease in the value of live stock.

The average expenditure for labor per farm in 1899 varied greatly. By far the highest expenditures were shown in the western counties, where there were numerous live-stock ranches, and the smallest amounts were paid in the eastern counties, containing large numbers of small cotton, dairy, and vegetable farms.

FARM TENURE.

Table 4 gives a comparative exhibit of farm tenure for 1880, 1890, and 1900. Tenants are divided into two groups: "Cash tenants," who pay a rental in cash or a stated share of labor or farm produce, and "share tenants," who pay as rental a stated share of the products.

In Table 5 the tenure of farms for 1900 is given by race of farmer, the farms operated by owners being subdivided into 4 groups, designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it, and the other or others owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive for their supervision and other services a fixed salary from the owners.

TABLE 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 TO 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.
1900	352,190	177,199	25,810	149,181	50.3	7.3	42.4
1890	228,126	132,616	20,081	75,429	58.1	8.8	33 1
1880	174,184	108,716	12,089	53,379	62.4	6.9	30.7

[1] Including "part owners," "owners and tenants," and "managers."

TABLE 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

PART 1.—NUMBER OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	352,190	151,954	21,005	1,680	2,560	25,810	149,181
White	286,654	134,829	18,107	1,564	2,469	17,370	112,315
Colored	65,536	17,125	2,898	116	91	8,440	36,866
Chinese	13					9	4
Indian	51	42	3			1	5
Negro	65,472	17,083	2,895	116	91	8,430	36,857

PART 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	100.0	43.1	6.0	0.5	0.7	7.3	42.4
White	100.0	47.0	6.3	0.5	0.9	6.1	39.2
Colored	100.0	26.1	4.4	0.2	0.1	12.9	56.3

In the period from 1880 to 1900 the total number of farms increased 102.2 per cent, and in the last decade 54.4 per cent. Since 1890 the number of farms operated by owners has increased 33.6 per cent; by cash tenants, 28.5 per cent; and by share tenants, 97.8 per cent. The percentages in Table 4 indicate that the number of farms operated by owners has not increased at so fast a rate since 1890 as the number of tenant-operated farms. Share tenants constituted 79.0 per cent of all tenants in 1890, and 85.3 per cent in 1900, the large percentage being due to the fact that the greatest number of cotton and hay and grain farms are reported as being operated by share tenants.

In 1900, 81.4 per cent of the farms of the state were operated by white farmers and 18.6 per cent by colored farmers. Of the white farmers, 53.9 per cent own all or a part of the farms they operate, and 46.1 per cent operate farms owned by others. The corresponding percentages for colored farmers are 30.7 and 69.3.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the number conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

TABLE 6.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS. Average.	Total.	Per cent.	VALUE OF FARM PROPERTY. Total.	Per cent.
The State	352,190	357.2	125,807,017	100.0	$962,476,273	100.0
White farmers	286,654	425.5	121,965,376	96.9	906,237,063	94.2
Negro farmers	65,472	58.6	3,835,979	3.1	56,180,207	5.8
Indian farmers	51	95.2	4,854	(1)	37,201	(1)
Chinese farmers	13	62.2	808	(1)	21,802	(1)
Owners	151,954	253.5	38,520,509	30.6	420,269,976	43.7
Part owners	21,005	1,244.6	26,143,033	20.8	129,742,464	13.5
Owners and tenants	1,680	327.7	550,519	0.4	5,159,859	0.5
Managers	2,560	16,402.9	41,991,308	33.4	149,302,594	16.5
Cash tenants	25,810	291.2	7,516,154	6.0	54,792,498	5.7
Share tenants	149,181	74.3	11,085,494	8.8	203,208,882	21.1

[1] Less than one-tenth of 1 per cent.

TABLE 7.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY RACE OF FARMER AND BY TENURE.

RACE OF FARMER, AND TENURE.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900. Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	Per cent of gross income on total investment in farm property.
The State	$1,680	$285	$85	$683	$594	21.8
White farmers	1,933	325	97	806	655	20.7
Negro farmers	571	109	33	144	329	38.3
Indian farmers	445	85	20	179	215	29.5
Chinese farmers	1,222	172	77	207	592	35.3
Owners	1,655	392	105	614	591	21.4
Part owners	3,515	430	132	2,100	1,038	16.8
Owners and tenants	1,854	400	114	703	656	21.4
Managers	34,324	1,229	503	22,265	7,386	12.7
Cash tenants	1,343	192	63	525	484	22.8
Share tenants	943	153	65	211	437	32.1

In all classes of farm property and in gross income white farmers show by far the highest values, with Chinese farmers ranking second. Negro farmers show the greatest per cent of average gross income on total investment, with Chinese ranking second, for these two classes have comparatively little invested. Colored farmers operate about one-fifth of the farms of the state, their farms constituting but 3.1 per cent of the total acreage and only 5.8 per cent of the total value of farm property.

Managers control the largest farms and more of the total area than any other class. The average values of all forms of farm property, and the average gross income are highest for farms operated by managers, but owing to the very large investments, the per cent of gross income is least. Owners operate a greater number of farms and control a greater part of the total value of farm property than any other class. Share tenants rank second in number of farms and total value, and first in per cent of gross income on investment.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS. Average.	Total.	Per cent.	VALUE OF FARM PROPERTY. Total.	Per cent.
The State	352,190	357.2	125,807,017	100.0	$962,476,273	100.0
Under 3 acres	1,302	2.2	2,864	(1)	2,945,115	0.3
3 to 9 acres	6,785	6.1	41,634	(1)	5,077,533	0.5
10 to 19 acres	19,633	14.4	282,457	0.2	10,617,827	1.1
20 to 49 acres	99,137	32.5	3,220,806	2.6	81,316,594	8.5
50 to 99 acres	88,537	70.7	6,261,082	5.0	134,544,833	14.0
100 to 174 acres	71,392	129.6	9,255,798	7.4	158,881,773	16.5
175 to 259 acres	24,000	208.0	4,991,057	4.0	77,956,188	8.1
260 to 499 acres	20,001	343.1	6,861,736	5.4	85,575,643	8.9
500 to 999 acres	10,183	660.9	6,730,336	5.3	63,564,773	6.6
1,000 acres and over	11,220	7,857.3	88,159,247	70.1	341,995,994	35.5

[1] Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900. Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	Per cent of gross income on total investment in farm property.
The State	$1,680	$285	$85	$683	$594	21.8
Under 3 acres	330	288	37	1,607	449	19.9
3 to 9 acres	288	252	36	172	162	21.6
10 to 19 acres	257	129	29	126	178	32.9
20 to 49 acres	491	131	41	157	314	38.3
50 to 99 acres	964	224	71	261	506	33.3
100 to 174 acres	1,426	318	99	382	626	28.2
175 to 259 acres	2,123	451	135	539	746	23.0
260 to 499 acres	2,794	534	160	791	794	18.6
500 to 999 acres	4,047	646	188	1,361	886	14.2
1,000 acres and over	17,845	1,063	316	11,258	3,625	11.9

The group of farms containing from 20 to 49 acres represents a larger number of farms than any other, but the group containing 1,000 acres and over comprises nearly three-fourths of the total acreage and more than one-third of the total value. Three-fourths of the farms in the latter group are large live-stock farms with the highest average values for all forms of farm property and the largest gross income, but the lowest per cent of gross income on investment of any class. For the group containing less than 3 acres, the values are comparatively high, as this class includes many live-stock farms using the public domain for range, besides several city dairies, truck farms, and others supplying city markets. The average gross income per acre for the various groups classified by area are as follows: Farms containing less than 3 acres, $204.27; 3 to 9 acres, $26.34; 10 to 19 acres, $12.37; 20 to 49 acres, $9.68; 50 to 99 acres, $7.15; 100 to 174 acres, $4.83; 175 to 259 acres, $3.59; 260 to 499 acres, $2.32; 500 to 999 acres, $1.34; 1,000 acres and over, $0.46.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading statistics relating to farms classified by principal source of income. If the value of hay and grain raised on any farm exceeds that of any other crop, and constitutes at least 40 per cent of the total value of products not fed to live stock, the farm is classified as a "hay and grain" farm. If vegetables are the leading crop, constituting 40 per cent of such products, it is a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive 40 per cent of their income from any one class of farm products. Farms for which no income was reported in 1899 are classified according to the agricultural operations upon other farms in the same locality.

TABLE 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	352,190	357.2	125,807,017	100.0	$962,476,273	100.0
Hay and grain	26,132	194.5	5,083,482	4.0	83,777,915	8.7
Vegetables	4,258	89.6	381,379	0.3	7,631,481	0.8
Fruit	1,129	95.5	107,837	0.1	3,200,359	0.3
Live stock	42,624	2,115.6	90,174,477	71.7	391,788,647	40.7
Dairy produce	4,668	200.1	934,253	0.7	14,115,155	1.5
Tobacco	160	140.4	22,462	(1)	603,976	0.1
Cotton	228,606	98.3	22,473,709	17.9	381,138,388	39.6
Rice	125	632.0	79,006	0.1	946,748	0.1
Sugar	264	392.4	103,599	0.1	1,854,087	0.2
Flowers and plants	66	4.0	267	(1)	306,423	(1)
Nursery products	73	67.6	4,932	(1)	355,758	(1)
Miscellaneous	44,085	146.1	6,441,614	5.1	76,757,336	8.0

1 Less than one-tenth of 1 per cent.

TABLE 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$1,680	$285	$85	$683	$594	21.8
Hay and grain	2,226	370	144	466	630	19.7
Vegetables	1,090	355	74	273	457	25.5
Fruits	1,840	549	100	346	692	24.4
Live stock	5,046	528	133	3,485	1,231	13.4
Dairy produce	1,680	504	105	735	599	19.8
Tobacco	2,622	475	94	584	959	25.4
Cotton	1,124	216	69	258	509	30.5
Rice	5,996	553	516	509	2,486	32.8
Sugar	5,011	579	1,007	426	897	12.8
Flowers and plants	2,714	1,770	112	47	1,548	33.3
Nursery products	3,365	1,143	167	198	4,027	82.6
Miscellaneous	998	309	82	352	398	22.9

For the several classes of farms, the average values per acre of products not fed to live stock are as follows: For farms deriving their principal income from flowers and plants, $382.66; nursery products, $59.60; fruit, $7.24; tobacco, $6.83; cotton, $5.17; vegetables, $5.10; rice, $3.93; hay and grain, $3.24; dairy produce, $2.99; miscellaneous, $2.73; sugar, $2.29; and live stock, $0.58.

The wide variations shown in the averages and percentages of gross income are largely due to the fact that in computing gross incomes no deductions are made for expenditures. For florists' establishments, nurseries, and market gardens, the average expenditure for such items as labor and fertilizers represents a far larger percentage of the gross income than in the case of "hay and grain," "live-stock," or "miscellaneous" farms. Were it possible to present the average net incomes the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by the reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.

$2,500 and over	28,994	1,812	585	18,352	9,057	18.2

Of the farms reporting no income in 1899, some were homesteads taken up too late for cultivation that year, some lay idle, others had crop failures, and some were summer homes conducted for pleasure and not for profit. Many were farms in charge, June 1, 1900, of persons who did not operate them in 1899, and could give no definite information concerning the crops of that year. To this extent the reports fall short of giving a complete exhibit of farm income in 1899.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the Twelfth Census. The age grouping for neat cattle was determined in accordance with their present and prospective relations to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits a very close comparison with the figures published in previous census reports.

Table 14 presents a summary of live-stock statistics.

Table 14.—DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS AND RANGES, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS OR RANGES.

LIVE STOCK.	Age in years.	ON FARMS AND RANGES.			NOT ON FARMS.
		Number.	Value.	Average value.	Number.
Calves	Under 1	2,148,261	$19,528,804	$9.09	43,747
Steers	1 and under 2.	957,163	14,007,199	14.63	8,439
Steers	2 and under 3.	593,603	12,106,522	20.39	2,719
Steers	3 and over	341,286	9,272,747	27.17	4,690

Ducks	....	234,664			
Bees (swarms of)	....	392,644	749,483	1.91	....
Unclassified	....	....	4,295	....	....
Value of all live stock.	....	....	240,576,955		

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.
[2] Including Guinea fowls.

The value of live stock on farms and ranges, June 1, 1900, was $240,576,955, or 25.0 per cent of the total value of farm property. Of this amount, 59.5 per cent represents the value of neat cattle other than dairy cows; 14.3 per cent, that of horses; 10.4 per cent, that of mules; 8.3 per cent, that of dairy cows; 3.2 per cent, that of swine; 1.7 per cent, that of sheep; 1.5 per cent, that of poultry; and 1.1 per cent, that of all other live stock.

No reports were secured of the value of live stock not on farms and ranges, but it is probable that such animals have higher average values than those on farms. Allowing the same averages, the value of domestic animals not on farms was $8,133,526, and the total value of domestic animals in the state, exclusive of poultry and bees not on farms, was approximately $248,710,481.

CHANGES IN LIVE STOCK ON FARMS.

Table 15 presents the changes in the number of the most important classes of domestic animals since 1850.

Table 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS AND RANGES: 1850 TO 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	861,023	8,567,173	1,269,432	523,690	1,439,940	2,665,614
1890[2]	1,003,439	5,198,113	1,026,002	227,432	3,454,858	2,252,476
1880[2]	606,176	3,478,429	805,606	132,447	2,411,633	1,950,371
1870	428,048	3,065,995	424,504	61,322	714,351	1,202,445
1860	601,540	2,934,228	325,698	63,334	753,363	1,371,532
1850	217,811	112,303	76,760	12,463	100,530	692,022

[1] Lambs not included.
[2] Exclusive of live stock on ranges.

The live-stock enumerations in 1880 and 1890 did not include domestic animals on ranges, and hence the figures for these years presented in the table are not strictly comparable with the figures for 1900. The number of animals on ranges in Texas and the Pan Handle in 1890 was estimated by special agents to be as follows: Dairy cows and "other neat cattle," 2,342,083; sheep, 809,329; horses, 99,838; swine, 2,744; mules and asses, 1,973. In comparing the number of animals reported in 1900 with the number reported in 1890, these estimates are disregarded.

Four times as many dairy cows were reported in 1900 as in 1850, although the last decade shows a decrease of 14.2 per cent. It is probable that this decrease is more apparent than real, as many of the 3,369,880 "cows and heifers not kept for milk" were doubtless cows milked for a time, but not "kept for milk" exclusively. The fact that twice as much milk was reported in 1900 as in 1890 supports this view.

The number of "other neat cattle" in 1900 is seventy-six times as great as in 1850, the gain in the last decade being 64.8 per cent. The report for 1900 includes 2,148,261 calves. It is uncertain whether or not calves were included in the reports for previous census years. If not, their number should be deducted from the total for 1900 when making comparison with such reports. In that case the gain since 1890 would be 23.5 per cent.

The number of horses has increased steadily since 1850. In 1900 there were sixteen times as many as in 1850, and 23.7 per cent more than in 1890. With the exception of the Civil War period, the increase in number of mules has been constant, forty-two times as many being reported in 1900 as in 1850, and more than twice as many as in 1890.

The number of sheep has fluctuated, but fourteen times as many were reported in 1900 as in 1850. For the last decade a decrease of 58.3 per cent is shown. Nearly four times as many swine were reported in 1900 as in 1850, and 18.3 per cent more than in 1890.

In comparing the poultry report for 1900 (see Table 14) with that of 1890, it should be borne in mind that in 1900 the enumerators were instructed to report no fowls under three months old, while in 1890 no such limitation was made. This fact explains, to a great extent, the comparatively small increases in numbers of chickens and turkeys, of 17.7 per cent and 21.0 per cent, respectively, and the decreases of 21.3 per cent and 40.0 per cent in the numbers of geese and ducks.

ANIMAL PRODUCTS.

Table 16 is a summarized exhibit of the products of the animal industry.

TABLE 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS, IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	9,638,002	$1,428,122
Mohair and goat hair	Pounds	274,810	77,478
Milk	Gallons	[1] 251,342,698	[2] 15,504,978
Butter	Pounds	47,991,492	
Cheese	Pounds	136,133	
Eggs	Dozens	58,040,810	4,672,187
Poultry			5,311,362
Honey	Pounds	4,780,204	468,527
Wax	Pounds	159,690	
Animals sold			34,357,265
Animals slaughtered			11,032,614
Total			72,852,533

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of milk sold or consumed, and of butter and cheese made.

In 1899 the value of animal products was $72,852,533, or 30.4 per cent of the value of all farm products. Of this amount, 62.3 per cent represents the value of animals sold and animals slaughtered on farms; 21.3 per cent, that of dairy produce; 13.7 per cent, that of poultry and eggs; 2.1 per cent, that of wool, mohair, and goat hair; 0.6 per cent, that of honey and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

Animals slaughtered were reported by 238,255 farmers, or 67.6 per cent of all in the state, the average value per farm being $46.31. Sales were reported by 141,533 farmers, or 40.2 per cent of the total number, the average receipts per farm being $242.75. Crane county reported sales from 7 farms amounting to $197,061, or an average of $28,151.57 per farm. In obtaining these reports the enumerators were instructed to secure from each farm operator a statement of the amount received from sales in 1899, less the amount paid for animals purchased during the same year.

DAIRY PRODUCE.

In 1899, 260,432 farmers, or 73.9 per cent of the total number, reported dairy produce. Of the $15,504,978 given in Table 16 as the value of dairy produce, 82.9 per cent represents the value of such produce consumed on farms, and 17.1 per cent, the receipts from sales of dairy produce. Of the latter amount, $1,331,235 was received from the sale of 7,928,646 pounds of butter; $1,276,438, from 8,091,205 gallons of milk; $32,981, from 46,406 gallons of cream; and $7,462, from 76,148 pounds of cheese.

Twice as much milk was reported in 1900 as in 1890. The quantity of butter made on farms increased 49.5 per cent in the last decade, but that of cheese decreased 6.6 per cent.

POULTRY, EGGS, WOOL, HONEY, AND WAX.

Of the $9,983,549 which is the value of poultry and eggs for 1899, 53.2 per cent represents the value of poultry raised, and 46.8 per cent, that of eggs produced. The production of eggs in 1899 was 78.8 per cent greater than in 1889.

The production of wool in 1899 was 35.4 per cent less than in 1889, although the average weight of fleeces increased in the same time from 3.9 pounds to 4.7 pounds.

The production of honey increased 45.5 per cent in the decade 1890 to 1900, and twice as much wax was reported in 1900 as in 1890.

HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses and dairy cows, the total number of these animals and the average number per farm. In computing the averages presented, only those farms which report the kind of stock under consideration are included.

TABLE 17.—HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.			DAIRY COWS.		
	Farms reporting.	Number.	Average per farm.	Farms reporting.	Number.	Average per farm.
Total	292,988	1,269,432	4.3	260,437	861,023	3.3
White farmers	244,631	1,165,981	4.8	231,132	796,442	3.4

Dairy	4,141	20,220	4.9	4,668	43,685	9.4
Tobacco	112	527	4.7	100	287	2.9
Cotton	185,557	505,255	2.7	160,760	442,196	2.8
Rice	111	423	3.8	74	157	2.1
Sugar	208	721	3.5	174	581	3.3
Miscellaneous[2]	37,460	131,473	3.5	37,564	124,266	3.3

[1] Including "part owners" and "owners and tenants."
[2] Including florists' establishments and nurseries.

CROPS.

The following table gives the statistics of the principal crops grown in 1899:

TABLE 18.—ACREAGES, QUANTITIES, AND VALUES OF THE PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantity.	Value.
Corn	5,017,690	Bushels	109,970,350	$34,424,871
Wheat	1,027,947	Bushels	12,266,320	7,051,477
Oats	847,225	Bushels	24,190,668	5,240,791
Barley	4,380	Bushels	80,366	33,354
Rye	3,984	Bushels	42,770	27,362
Buckwheat	41	Bushels	333	310
Broom corn	3,743	Pounds	1,638,150	60,313
Rice	8,711	Pounds	7,186,863	224,387
Kafir corn	22,813	Bushels	482,096	130,01[illegible]
Flaxseed	75	Bushels	640	561
Clover seed		Bushels	94	380
Grass seed		Bushels	20,398	13,594
Hay and forage	938,024	Tons	1,494,305	7,294,450
Cottonseed		Tons	[1]1,262,651	12,396,591
Cotton	6,960,367	Bales	2,506,212	84,332,713
Tobacco	1,443	Pounds	550,120	104,694
Peanuts	10,734	Bushels	184,860	178,542
Dry beans	2,878	Bushels	28,129	40,652
Dry pease	33,974	Bushels	333,462	349,306
Potatoes	21,810	Bushels	1,342,316	725,145
Sweet potatoes	43,561	Bushels	3,299,135	1,689,015
Onions	1,639	Bushels	187,720	150,675
Miscellaneous vegetables	110,260			5,109,963
Sugar cane	17,824	Tons	170,485	
(a) Cane sold		Tons	54,758	219,905
(b) Sugar made		Pounds	2,789,250	134,074
(c) Molasses made		Gallons	98,950	6,719
(d) Sirup made		Gallons	888,637	365,819
Sorghum cane	26,803	Tons	[2]88,933	263,518
Sorghum sirup		Gallons	877,232	291,272
Sugar beets	135	Tons	523	2,451
Small fruits	3,904			304,680
Grapes	[3]2,213	Centals	40,862	[4]126,355
Orchard fruits	[3]121,797			[5]1,345,423
Tropical fruits				12,996
Nuts				78,971
Forest products				3,776,569
Flowers and plants	167			120,249
Seeds	17			2,901
Nursery products	2,093			314,511
Miscellaneous	324			25,138
Total	15,236,576			166,970,711

[1] Exclusive of 29,761 tons, valued at $292,253, sold in seed cotton and included with the cotton.
[2] Sold as cane.
[3] Estimated from number of vines or trees.
[4] Including value of raisins, wine, etc.
[5] Including value of cider, vinegar, etc.

Of the total value of crops, cotton and cottonseed contributed 57.9 per cent; cereals, including Kafir corn, 28.2 per cent; hay and forage, 4.4 per cent; miscellaneous vegetables, 3.1 per cent; forest products, 2.3 per cent; sweet potatoes, 1.0 per cent; orchard fruits, 0.8 per cent; and all other products, 2.3 per cent.

The average values per acre of the various crops are as follows: Flowers and plants, $720; nursery products, $150; onions, $92; small fruits, $78; tobacco, $73; grapes, $57; miscellaneous vegetables, $46; sugar cane and sugar-cane products, $41; sweet potatoes, $39; potatoes, $33; sorghum cane and sorghum sirup, $21; peanuts, $17; broom corn, $16; dry beans, $14; cotton and cottonseed, $14; orchard fruits, $11; dry pease, $10; hay and forage, $8; and cereals, $7. The crops yielding the highest average returns per acre were grown upon very highly improved land. Their production requires a relatively great amount of labor, and large expenditures for fertilizers.

COTTON.

The following table shows the changes in cotton production since 1849:

TABLE 19.—ACREAGE AND PRODUCTION OF COTTON: 1849 TO 1899.

YEAR.	ACREAGE.		PRODUCTION.		
	Total.	Per cent of increase.	Commercial bales.	Pounds.	Per cent of increase.
1899	6,960,367	76.9	2,506,212	1,292,404,967	84.2
1889	3,934,525	80.6	1,471,242	701,782,434	92.4
1879	2,178,435		805,284	364,793,652	139.7
1869				152,172,552	[1]20.7
1859				192,001,035	726.6
1849				23,228,800	

[1] Decrease.

In 1859 the total number of pounds of cotton produced in Texas was over eight times as great as the quantity reported for the previous census. During the next decade, the Civil War caused a depression in all industries and there was a decrease of 20.7 per cent. For the year 1879 there is recorded an increase of over 200,000,000 pounds, and although the percentage of gain lessened in the following decade, there was a steady increase in both the area under cultivation and in the quantity of cotton grown.

In 1899, 284,037 farmers devoted to cotton 6,960,367 acres, or 35.6 per cent of the total improved farm land of the state, and an average of 24.5 acres per farm. From this land was produced 1,292,404,967 pounds of cotton, an average of 4,550 pounds per farm, 186 pounds per acre, and 424 pounds per capita.

The total value of this product, including the value of the cottonseed, was $96,729,304, an average of $340.55 per farm, and $13.90 per acre. This value constituted 46.2 per cent of the gross farm income.

The counties devoting the greatest area to the production of cotton were Ellis, McLennan, Fannin, Hill, Navarro, Williamson, Falls, Milam, and Bell, ranking in the order named, and reporting 20.5 per cent of the total acreage. These counties are located in a belt extending north from Austin to the Red River. Little or no cotton is raised in the counties along the western border of the state or those in the extreme north or south.

CEREALS.

Table 20 is a statement of the changes in cereal production since 1849.

TABLE 20.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899.

PART 1.—ACREAGE.

YEAR.[1]	Barley.	Corn.	Oats.	Rice.	Rye.	Wheat.
1899	4,380	5,017,690	847,225	8,711	3,984	1,027,947
1889	2,782	3,079,907	528,924	178	5,255	352,477
1879	5,527	2,468,587	238,010	335	3,326	373,570

[1] No statistics of acreage were secured prior to 1879.

TABLE 20.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899—Continued.

PART 2.—BUSHELS PRODUCED.[1]

YEAR.[2]	Barley.	Corn.	Oats.	Rice.	Rye.	Wheat.
1899	80,366	109,970,350	24,190,668	7,186,863	42,770	12,266,320
1889	48,152	69,112,150	12,581,360	168,423	62,370	4,283,344
1879	72,786	29,065,172	4,893,359	62,152	25,399	2,567,737
1869	44,351	20,554,538	762,663	63,844	28,521	415,112
1859	67,562	16,500,702	985,889	26,031	111,860	1,478,345
1849	4,776	6,028,876	199,017	88,203	3,108	41,729

[1] Rice reported in pounds.
[2] No statistics of acreage were secured prior to 1879.

The total area devoted to cereals in 1879 was 3,089,403 acres; in 1889, 3,969,622 acres; and in 1899, 6,932,791, an increase for the twenty years of 124.4 per cent. In addition to the acreages mentioned in the table, those for buckwheat in 1879, 1889, and 1899, and for Kafir corn in 1899 are included in these totals. The increase in the areas devoted to the various cereals in the decade from 1889 to 1899 were: Rice, approximately, fiftyfold; wheat, 191.6 per cent; corn, 62.9 per cent; oats, 60.2 per cent; and barley, 57.4 per cent. There was a decrease in acreage under rye of 24.2 per cent.

Of the total area under cereals in 1899, 72.4 per cent was devoted to corn; 14.8 per cent, to wheat; 12.2 per cent, to oats; 0.3 per cent, to Kafir corn; and 0.3 per cent, to barley, buckwheat, rice, and rye.

Corn, wheat, oats, rye, Kafir corn, and barley were reported from nearly all parts of the state. Buckwheat was grown in 9 counties only, and rice in 17 counties, in the southeastern part of the state. Of these 17 counties, 2, Jefferson and Orange, furnished 94.2 per cent of the entire acreage in rice.

HAY AND FORAGE.

In 1900, 95,371 farmers, or 27.1 per cent of the total number, reported hay or forage crops. Excluding cornstalks and corn strippings, they obtained an average yield of 1.6 tons per acre. The total acreage in hay and forage for 1899 was 938,024, or 148.5 per cent greater than ten years before.

In 1899 the acreages and yields of the various kinds of hay and forage were as follows: Wild, salt, and prairie grasses, 286,079 acres and 280,145 tons; millet and Hungarian grasses, 152,750 acres and 234,680 tons; alfalfa or lucern, 18,999 acres and 33,394 tons; clover, 1,940 acres and 3,344 tons; other tame and cultivated grasses, 63,605 acres and 88,645 tons; grains cut green for hay, 52,051 acres and 87,273 tons; crops grown for forage, 362,600 acres and 738,971 tons; cornstalks and corn strippings, 79,150 acres and 27,853 tons.

In Table 18 the production of cornstalks and corn strippings is included under "hay and forage," but the acreage is included under "corn," as the forage secured was an incidental product of the corn crop.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 are shown in the following table:

TABLE 21.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES. 1900	NUMBER OF TREES. 1890	BUSHELS OF FRUIT. 1899	BUSHELS OF FRUIT. 1889
Apples	1,484,846	622,801	591,985	742,993
Apricots	35,301	7,220	1,620	1,580
Cherries	36,800	14,241	2,189	3,863
Peaches	7,248,358	4,486,901	1,400,240	5,106,332
Pears	1,044,680	37,370	166,418	17,034
Plums and prunes	1,121,589	688,995	180,813	160,256

The total number of fruit trees in 1890 was 5,857,528. In 1900 there were 11,036,196, showing an increase of 5,178,668, or 88.4 per cent. The rates of increase for the decade are as follows: Apples, 138.4 per cent; apricots, 388.9 per cent; cherries, 158.4 per cent; peaches, 61.5 per cent; and plums and prunes, 62.8 per cent. The number of pear trees is 27 times as great as it was in 1890.

Of the total number of trees reported in 1900, 13.4 per cent were apple trees; 65.7 per cent, peach trees; 10.2 per cent, plum and prune trees; 9.5 per cent, pear trees; and 1.2 per cent, apricot, cherry, and unclassified trees. The last mentioned, which are not included in the table, numbered 64,622 trees, and yielded 16,466 bushels of fruit.

The value of orchard products, given in Table 18, includes the value of 1,764 barrels of cider, 1,386 barrels of vinegar, and 84,630 pounds of dried and evaporated fruits. All these orchard fruits are grown quite generally throughout the state, but 57.6 per cent of the pear trees are reported from the counties of Brazoria, Galveston, and Harris.

SMALL FRUITS.

Of the 3,904 acres devoted by 6,496 farmers to small fruits, 1,802 acres, or nearly one-half, were reported by Smith, Galveston, Brazoria, and Tarrant counties, all of which are situated in the eastern part of the state. Blackberries and dewberries occupied 2,394 acres, or 61.3 per cent of the total area, and yielded 2,701,750 quarts. The acreages and productions of other berries were as follows: Strawberries, 1,361 acres and 2,344,220 quarts; raspberries and Logan berries, 103 acres and 123,640 quarts; currants, 4 acres and 5,370 quarts; gooseberries, 1 acre and 760 quarts; and other small fruits, 41 acres and 33,180 quarts.

VEGETABLES.

The total value of vegetables grown in 1899, including potatoes, sweet potatoes, and onions, was $7,674,798, of which 22.0 per cent represents the value of sweet potatoes; 9.4 per cent, that of potatoes; 2.0 per cent that of onions; and 66.6 per cent, that of miscellaneous vegetables.

Sweet potatoes were grown in 1899 by 63,209 farmers, or 17.9 per cent of the total number in the state. The area devoted to this crop in 1889 was 52,506 acres, and in 1899, 43,561 acres, a decrease of 17.0 per cent.

In the growing of miscellaneous vegetables, 110,260 acres were used. The products of 68,849 acres were not reported in detail. Of the remaining 41,411 acres, 26,276 acres were devoted to watermelons; 5,781 acres, to muskmelons; 4,088 acres, to cabbages; 2,821 acres, to tomatoes; 952 acres, to sweet corn; 855 acres, to cucumbers; and 638 acres, to other vegetables.

SUGAR CANE.

Table 22 presents a comparative exhibit of the acreage of sugar cane and the production of sugar and sirup, 1849 to 1899.

TABLE 22.—ACREAGE OF SUGAR CANE AND PRODUCTION OF SUGAR AND SIRUP: 1849 TO 1899.

YEAR.[1]	Acreage in cane.	SUGAR. Production in pounds.	SUGAR. Average yield per acre in pounds.	SIRUP. Production in gallons.	SIRUP. Average yield per acre in gallons.
1899	17,824	2,789,250	156.5	987,587	55.4
1889	16,284	5,482,030	336.6	2,159,339	132.6
1879	10,224	5,941,200	581.1	810,605	79.3
1869	....	2,424,000	....	246,062	....
1859	....	6,118,800	....	408,358	....
1849	....	8,821,200	....	....	....

[1] No statistics of acreage were secured prior to 1879.

The present census shows that in 1899 sugar cane was grown by 15,694 farmers on 17,824 acres, an average of 1.1 acres for each farm reporting. From this area they sold 54,758 tons of cane for $219,905, and from the remaining product, manufactured 987,587 gallons of sirup and molasses, valued at $372,538, and 2,789,250 pounds of sugar, valued at $134,074. This was an increase of 9.5 per cent in acreage over that reported for 1889. The total value of the sugar-cane products was $726,517, an average of $46.29 for each farm reporting, and of $40.76 per acre. The average value of the sugar was 4.8 cents per pound, and of the sirup and molasses, 37.7 cents per gallon.

SORGHUM CANE.

Sorghum cane was grown in 1899 by 31,948 farmers on 26,803 acres, an average of 0.8 acre for each farm reporting. From this area they sold 88,933 tons of cane for $263,518, and from the remaining product, manufactured 877,232 gallons of sirup, valued at $291,272. This was a decrease in acreage from 1889 of 6.1 per cent. The total value of sorghum-cane products was $554,790, an average of $17.36 for each farm reporting, and of $20.70 per acre. The average value per gallon was 33.2 cents.

TOBACCO.

The present census shows that in 1899 tobacco was grown by 1,746 farmers, who reported 1,443 acres, and a yield of 550,120 pounds, a gain in ten years of 241.1 per cent in acreage and 213.1 per cent in production. The production of 1899 was the largest ever reported. The next largest was in 1879, when 685 acres yielded 221,283 pounds. The average yield per acre in 1899 was 381.2 pounds, compared with 415.4 pounds in 1889. The total value of the 1899 crop was $104,694, an average of $59.96 for each farm reporting, and of $72.55 per acre. The average value per pound was 19 cents. The crop was grown in 98 counties, Montgomery county leading, with 507 acres, or 35.1 per cent of the total.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 167 acres, and the value of the products sold therefrom was $120,249. These flowers and plants were grown by 157 farmers and florists, of whom 66 made commercial floriculture their principal business. The capital invested in land, buildings, implements, and live stock was $306,423, of which $116,825 represents the value of buildings. Their sales of flowers and plants amounted to $93,259, and they obtained other products valued at $8,910. The expenditure for labor was $28,000, and for fertilizers, $1,575. The average income for each farm reporting (including products fed to live stock) was $1,551.

In addition to 59 of the florists' establishments, 208 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 171,474 square feet, making, with the 223,106 square feet belonging to the florists' establishments, a total of 394,580 square feet.

NURSERIES.

The total value of nursery products sold in 1899 was $314,511, reported by the operators of 223 farms and nurseries. Of this number, 73 derived their principal income from the nursery business. They had 4,932 acres of land valued at $245,650, buildings worth $83,445, implements and machinery worth $12,209, and live stock worth $14,454. Their total income, exclusive of products fed to live stock, was $293,945, of which $264,425 represents the value of nursery stock and $29,520 that of other products. The expenditure for labor was $42,740 and for fertilizers, $2,405. The average income for each farm reporting (including products fed to live stock) was $4,074.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $12,331,905, an average of $35 per farm. About one-half of this amount was expended for labor on cotton farms and nearly one-third for labor on live-stock farms. The average expenditure was $585 for nurseries, $452 for rice farms, $424 for florists' establishments, $112 for tobacco farms, $93 for live-stock farms, $89 for sugar farms, $57 for fruit farms, $47 for hay and grain farms, $45 for dairy farms, $32 for vegetable farms, and $25 for cotton farms. "Managers" expended, on an average, $833; "owners," $34; "cash tenants," $29; and "share tenants," $18. White farmers expended $41 per farm, and colored farmers, $9.

Fertilizers purchased in 1899 cost $124,716, an average of only 35 cents per farm, but an increase since 1890 of 112.6 per cent. The average expenditure was $69 for rice farms, $33 for nurseries, $24 for florists' establishments, $14 for tobacco farms, $4 for fruit farms, $2 for vegetable, dairy, and sugar farms, and less than $1 for hay and grain, live-stock, and cotton farms.

IRRIGATION STATISTICS.

Texas, with its vast area and greatly diversified topography and climate, contains areas well adapted to the successful cultivation of a wide variety of agricultural products. As the larger part of the state belongs to the humid region, irrigation has never been a prominent factor in agricultural development.

The arid region may be described as belonging to the drainage basin of the Rio Grande and Pecos rivers, and includes the counties of Pecos, Reeves, El Paso, Jeff Davis, Presidio, Brewster, and Ward. The elevation of this portion of the state varies from 2,000 to 6,000 feet and the annual precipitation ranges from 8 to 17 inches. The soil, particularly in the valley of the Rio Grande, is of exceeding fertility when sufficiently watered, and is adapted to the cultivation of almost all the agricultural products of the temperate and subtropical climates. In this valley irrigation is of ancient origin, and on many of the canals the methods of irrigating have undergone little change in the last two centuries. The irrigation of general crops in Texas is confined largely to the region above described.

In 1899 the number of irrigators in arid Texas was 429, or 32.4 per cent of all; the ditches had a length of 212 miles, or 47.1 per cent of the total length, and the cost of construction was $407,635, or 39.7 per cent of the total cost of all the systems of the state. El Paso county, with six large canals having a total length of 92 miles, leads all others in the number of irrigators and in the mileage of ditches.

At El Paso, after passing through a deep canyon in the Franklin Range, the Rio Grande flows out upon a broad valley which has a length of 60 miles and a general elevation of 4,000 feet. The bed of the river at this point is unstable and is often changed several miles during a flood. The banks are generally low, affording an excellent opportunity for the intake of gravity ditches. Sixty miles below El Paso the valley of the Rio Grande suddenly contracts where the river passes through the Whitman Mountains. From this point down to Del Rio, a distance of 400 miles, its course is through canyons in a region of wild and picturesque scenery and no opportunities are presented for irrigation, except at one point in Presidio county, near Fort Leaton, where it flows out upon a narrow valley for about 25 miles. In this valley it receives from Mexico the waters of an important tributary—the Concho. At Del Rio and 50 miles below, near Eagle Pass, the Rio Grande supplies water for several canals. A number of pumping stations are used in the vicinity of Laredo, Carrizzo, Rio Grande, Hidalgo, and Brownsville.

For a number of years during the irrigating season there was a shortage of the water supply in the Rio Grande. In the census year it sufficed for only one irrigation in El Paso county, and no crops were harvested, except a small quantity of hay and forage which yielded but slight returns. The marked yearly decrease in the volume of the Rio Grande has been the cause of much distress and suffering in that part of the state which is dependent upon this stream for water. Although the ditches in El Paso county cover 30,000 acres of land, in 1899 crops were grown on only 4,826 acres, and the products generally were such as would mature with water received during the flood season. The Rio Grande Valley in this county, once one of the most fertile and productive in the country, is rapidly returning to its original state—that of a desert.

Large canals along the Rio Grande in Colorado and Mexico exhaust the normal flow, and until a system of reservoirs is constructed to hold the flood waters, most of the farms in this part of Texas will have to be abandoned. A reservoir site has been surveyed and its capacity is claimed to be sufficient to irrigate all the arable land for 40 miles below El Paso on both sides of the river. As its construction involves questions of international importance, this work can not be attempted with private capital.

The Pecos River, flowing through arid and semiarid Texas, irrigates considerable areas in the counties of Reeves, Ward, and Pecos. The canals are of great length and designed to irrigate large areas. The irrigated acreage under ditches is about 70,000, and the irrigation systems have a total length of 104 miles and cost $231,800. In 1899 the acreage irrigated by them was 15,465.

In explanation of the small acreage cultivated, it may be stated that from the constant use of the water of the Pecos River for irrigation in New Mexico, it has become impregnated with mineral matter which is injurious to vegetable growth, and, until some remedy is found for this, the further extension of irrigated areas is not probable.

There are a number of irrigation systems in the valleys of the Colorado and Brazos rivers, several of considerable importance, used in the cultivation of forage crops, grain, orchard and small fruits, and truck. Many crops in this section were seriously damaged by severe floods early in June, 1899, and many irrigation plants were entirely destroyed. Some of the most important canals are at Menardville and San Angelo. During the census year in Tom Green and Menard counties there were 157 irrigators, operating 17 plants, costing $84,325, having a length of 69.9 miles, and irrigating 7,563 acres.

In 1889 there were 623 irrigators in the state, and in 1899, 1,325, an increase of 112.7 per cent. Within the same period, the number of irrigated acres increased from 18,241 to 49,652, or 172.2 per cent. Not including the area irrigated in rice, the increase in irrigated acreage in the state is 69.7 per cent.

The total value of all crops produced on irrigated land in 1899 was $539,212, divided as follows: Rice, $224,315; hay and forage, $101,569; cereals, $64,107; vegetables, $99,240; orchard fruits, $17,175; small fruits, $1,134; all other crops, $31,672.

The following table gives the number of irrigators and acreage irrigated in 1899, with the number and cost of construction of irrigation systems and the length of main ditches:

Table A.—NUMBER OF IRRIGATORS AND ACREAGE IRRIGATED IN 1899, WITH NUMBER AND COST OF CONSTRUCTION OF IRRIGATION SYSTEMS AND LENGTH OF MAIN DITCHES.

COUNTIES.	Number of irrigators.	Acreage irrigated.	IRRIGATION SYSTEMS.			
			Number.	Cost of construction.		Total length, of main ditches.
				Total.	Average per acre irrigated.	
The State [1] ...	[2]1,325	49,662	581	$1,027,608	$20.70	449.9
Bexar	76	1,720	4	13,600	7.91	16.0
Colorado	3	200	3	26,000	130.00	1.0
El Paso	200	4,826	6	192,200	39.83	92.0
Irion	35	760	3	2,450	3.22	9.5
Jefferson	37	5,859	10	265,000	45.23	20.0
Menard	70	2,820	5	30,400	10.78	18.8
Orange	19	2,352	4	29,337	12.47	7.0
Pecos	17	4,568	7	27,800	6.09	47.0
Presidio	25	1,404	4	8,550	6.09	6.6
Reeves	33	6,757	7	19,000	2.81	23.0
San Saba	28	464	15	3,825	8.24	7.2
Tom Green	87	4,743	12	53,925	11.37	50.8
Uvalde	9	366	9	5,500	15.03	6.5
Valverde	43	2,179	1	25,000	11.47	8.0
Ward	131	4,148	2	185,000	44.60	34.0
Other counties (107)	512	6,486	489	140,021	21.59	102.5

[1] Irrigation reported from 122 counties.
[2] Includes 95 irrigators from wells irrigating 385 acres; cost of plants approximately $17,193.

The relatively high average cost of construction per acre irrigated in Colorado and Jefferson counties is explained by the fact that the pumping plants have been only recently established and in 1899 were not utilized to their full capacity. The area capable of being irrigated by these systems is greatly in excess of that reported as irrigated in the census year.

RICE IRRIGATION.

The rice belt, which extends from Sabine county on the east to the Rio Grande on the southwest, includes all the counties bordering on the Gulf and several adjoining. Rice irrigation in Texas really began in 1897, the industry receiving great impetus from the success of the planters in southwest Louisiana. As southeastern Texas is an extension of the fertile prairies which have proven so well adapted to the growing of this cereal in Louisiana, the areas in rice have increased greatly each year. The rice belt at present includes two well-developed zones, the Beaumont, and the Colorado River valley. Beaumont section is a level prairie which, until a few years ago, was not deemed of much value for agricultural purposes. The slope is rarely more than one foot to the mile and the elevation is about 250 feet above the sea level at distances from 50 to 125 miles from the Gulf. In 1899, with the exception of 200 acres in the Colorado Valley and a few small areas in other counties, all of the irrigated rice was grown in this section. Jefferson county reported 5,859 acres in rice, yielding 5,643,194 pounds, or 67.3 per cent of the total acreage and 78.5 per cent of the total yield of the state. There were ten irrigation systems in this county, representing an expenditure for construction of $265,000. The total length of the main ditches was 20 miles.

The methods of cultivating and harvesting rice in Texas are the same as those of southwestern Louisiana. The rice is sown broadcast or with drills, on comparatively high land, from April 15 to June 15. From $1\frac{1}{4}$ bushels to $1\frac{3}{4}$ bushels are sown to the acre, the land having been plowed and harrowed as for wheat. The rice lands are flooded after the rice is up to the height of from 3 to 6 inches, the water being kept on the land from 90 to 110 days. The water kills the grass and weeds and promotes the rapid growth of the plant. From 10 to 20 days before harvest, depending upon the growth and nature of the soil, the levees at the lower sides of the fields are opened and the water is drawn off by means of ditches. The rice is cut with self-binders and thrashed from the shock or stacked to suit the convenience of the farmers. The same kind of machinery is used in cultivating, harvesting, and thrashing rice as is used with wheat in the Northwest.

The following table shows the number of irrigated rice farms, the acreage, yield, and value of crop, 1899:

TABLE B.—IRRIGATED RICE, BY COUNTIES.

COUNTIES.	Farms reporting.	Acres.	Pounds.	Value.
Chambers	2	37	9,360	$240

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 230. WASHINGTON, D. C. July 3, 1902.

AGRICULTURE.

OKLAHOMA.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

SIR: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the territory of Oklahoma, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land, under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It includes also the house in which the farmer resides, and all other buildings used by him in connection with his farming operations.

The farms of Oklahoma, June 1, 1900, numbered 62,495, and were valued at $123,941,235. Of this amount, $13,731,585, or 11.1 per cent, represents the value of buildings, and $110,209,650, or 88.9 per cent, the value of land and improvements other than buildings. On the same date the value of farm implements and machinery was $6,573,015, and of live stock, $54,829,568. These values, added to that of farms, give $185,343,818, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $45,447,744, of which amount $18,582,351, or 40.9 per cent, represents the value of animal products, and $26,865,393, or 59.1 per cent, the value of crops, including forest products cut or produced on farms. The total value for 1899 exceeds that reported for 1889 by $45,007,369, or more than one hundred times.

The "gross farm income" is obtained by deducting from the total value of farm products the value of the products fed to live stock on the farms of the producers. In 1899 the reported value of products fed was $8,109,946, leaving $37,337,798 as the gross farm income. The ratio which this amount bears to the "total value of farm property" is referred to in this bulletin as the "percentage of gross income upon investment." For Oklahoma in 1899 it was 20.1 per cent.

As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

The statistics presented in this bulletin will be treated in greater detail in the report on agriculture in the United States. The present publication is designed to present a summarized advance statement for Oklahoma.

Very respectfully,

L. G. Powers.

Chief Statistician for Agriculture.

AGRICULTURE IN OKLAHOMA.

GENERAL STATISTICS.

Oklahoma has a total land area of 38,830 square miles, or 24,851,200 acres, of which 15,719,258 acres, or 63.3 per cent, are included in farms.

The surface of the territory is a high, gently rolling slope, whose elevation above sea level ranges from 500 to 4,000 feet. In the central portion of the territory are a few mountains, east of which are broad, fertile valleys. To the north and west are undulating uplands, requiring only irrigation to make them yield abundantly. The principal rivers extend generally from northwest to southeast, and afford sufficient water facilities for all sections.

The soil is mostly a rich red clay, or sandstone decomposition, mixed, in the valleys, with black alluvial deposits. It is of sufficient depth and character to render it almost inexhaustible, and needs no fertilization.

NUMBER AND SIZE OF FARMS.

Table 1 gives, for the years 1890 and 1900, the number of farms, the total and average acreage, and the per cent of farm land improved.

TABLE 1.—FARMS AND FARM ACREAGE: 1890 AND 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	62,495	15,719,258	5,511,994	10,207,264	251.5	35.1
1890	8,826	1,606,423	563,728	1,042,695	182.0	35.1

There were more than seven times as many farms in the territory in 1900 as in 1890, with nearly ten times as great an area devoted to agriculture. The average size of farms almost doubled, but the ratio of improved and unimproved land remained unchanged.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for the census years 1890 and 1900.

TABLE 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND OF FARM PRODUCTS: 1890 AND 1900.

YEAR.	Total value of farm property.	Land, improvements and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$185,343,818	$123,941,235	$6,573,015	$54,829,568	$45,447,744
1890	12,221,020	8,581,170	433,580	3,206,270	440,375

[1] For year preceding that designated.

The last decade shows very great progress in all agricultural pursuits, with from fourteen to seventeen times as great amounts invested, and more than one hundred times as great a value of products in 1900 as in 1890.

COUNTY STATISTICS.

Table 3 gives an exhibit of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS, AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH VALUE OF PRODUCTS OF 1899 NOT FED TO LIVE STOCK, AND EXPENDITURE IN 1899 FOR LABOR, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Value of products not feed to live stock.	Expenditure for labor.
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The Territory	62,495	60,505	15,719,258	5,511,994	$110,209,650	$13,731,585	$6,573,015	$54,829,568	$37,337,798	$2,359,650

[1] Indian reservation.

The number of counties in Oklahoma increased in the last decade from 8 to 23, rendering comparisons by counties for the last two census years very difficult. The total acreage increased nearly tenfold, and more than doubled for all of the original counties but one. In three counties the improved acreage increased more than fivefold. The average size of farms is largest in the western counties where stock raising and cereal production are the principal industries, and smallest in the southeastern counties, which contain a number of cotton and vegetable farms, though the size does not vary greatly in any section of the territory. The size of farms on Indian reservations is larger than in the counties, bringing the territorial average up to 251.5 acres.

Many of the counties show more than a threefold increase over the total farm values reported ten years before. For the territory, the average value of farms in 1900 was $1,983, more than double that reported in 1890. A large gain in the value of implements and machinery was reported for all counties. The value of live stock also shows a general increase, the average value per farm being more than twice as great as in 1890.

The expenditure for labor in 1899 averaged $38 per farm. It varied greatly in the different parts of the territory, being very much higher in counties containing many live stock and grain farms than in those devoted to general farming.

FARM TENURE.

Table 4 gives a comparative statement of farm tenure for 1890 and 1900. The farms operated by tenants are divided into two groups designated as farms operated by "cash tenants" and "share tenants." These groups comprise, respectively: (1) Farms operated by individuals who pay a rental in cash or a stated amount of labor or farm produce; (2) farms operated by individuals who pay as rental a stated share of the products.

In Table 5 the tenure of farms for 1900 is given by race of farmer, the farms operated by owners being subdivided into four groups designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These terms denote, repectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it, and the other or others owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive for their supervision and other services a fixed salary from the owners.

TABLE 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURE: 1890 AND 1900.

YEAR.	Number of farms.	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.
1900	62,495	49,346	5,020	8,129	79.0	8.0	13.0
1890	8,826	8,761	13	52	99.3	0.1	0.6

[1] Including "part owners," "owners and tenants," and "managers."

TABLE 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURE, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

PART 1.—NUMBER OF FARMS OF SPECIFIED TENURE.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The Territory	62,495	42,241	6,113	686	306	5,020	8,129
White	59,324	39,863	6,014	666	298	4,843	7,640
Indian	915	881	5	5	2	5	17
Negro	2,256	1,497	94	15	6	172	472

PART 2.—PER CENT OF FARMS OF SPECIFIED TENURE.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The Territory	100.0	67.6	9.8	1.1	0.5	8.0	13.0
White	100.0	67.2	10.1	1.1	0.5	8.2	12.9
Indian	100.0	96.4	0.5	0.5	0.2	0.5	1.9
Negro	100.0	66.3	4.2	0.7	0.3	7.6	20.9

The number of farms operated by owners, June 1, 1900, was nearly six times as great as the number reported in 1890, the increase for the decade being 40,585. This increase was less rapid than that in the total number of farms, hence, the per cent of farms operated by this class was 20.3 less than in 1890. The corresponding increase in the percentages of tenant-operated farms gives to cash tenants an increase of 7.9, and to share tenants, 12.4. These great increases are largely due to the opening to settlement of large tracts of Government lands.

Of the total number of farms, 5.1 per cent are operated by colored farmers, of whom about one-third are Indians. Of the white farmers, 78.4 per cent own all or a part of the land they operate, while for colored farmers this percentage is 78.7.

The census of 1890 did not report the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the per cent of farms conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

TABLE 6.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The Territory	62,495	251.5	15,719,258	100.0	$185,343,818	100.0
White farmers	59,324	256.5	15,217,347	96.8	179,895,037	97.0
Indian farmers	915	256.8	234,954	1.5	2,527,455	1.4
Negro farmers	2,256	118.3	266,957	1.7	2,921,326	1.6
Owners	42,241	164.2	6,935,760	44.1	98,401,427	53.1
Part owners	6,113	445.1	2,720,961	17.3	30,066,722	16.2
Owners and tenants	686	191.1	131,115	0.8	1,830,494	1.0
Managers	306	6,018.8	1,841,750	11.7	16,618,885	9.0
Cash tenants	5,020	564.8	2,835,470	18.1	22,211,948	12.0
Share tenants	8,129	154.3	1,254,202	8.0	16,214,342	8.7

TABLE 7.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY RACE OF FARMER AND BY TENURE.

RACE OF FARMER, AND TENURE.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The Territory	$1,764	$220	$105	$877	$597	20.1
White farmers	1,800	224	108	900	616	20.3
Indian farmers	1,628	220	93	822	187	6.8
Negro farmers	848	94	47	306	271	20.9
Owners	1,476	213	99	542	477	20.5
Part owners	2,689	350	177	1,702	1,105	22.5
Owners and tenants	1,709	243	105	611	566	21.2
Managers	23,716	818	280	29,496	10,960	20.2
Cash tenants	2,437	183	104	1,701	697	15.7
Share tenants	1,322	157	78	438	392	19.7

The average values of farm property for Indian farmers are but little lower than for white farmers, but the average and percentage of gross income are very much lower. All the averages are very much lower for negro farmers, but the per cent of gross income is highest for this group. This high rate of gross income is due to the smaller average area and more intensive cultivation of the farms of this group and to the low values of farm property or capital invested.

The farms operated by managers are larger, have more capital invested, and a much larger gross income than any other class. The ratio which the latter amount bears to the total value of their farm property is, however, smaller than for some other tenure groups, because of the high average valuation of land and buildings.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The Territory	62,495	251.5	15,719,258	100.0	$185,343,818	100.0
Under 3 acres	76	2.0	152	[1]	511,932	0.3
3 to 9 acres	223	7.8	1,732	[1]	152,851	0.1
10 to 19 acres	458	15.9	7,304	[1]	236,294	0.1
20 to 49 acres	2,759	34.9	96,360	0.6	2,025,802	1.1
50 to 99 acres	6,425	77.6	498,382	3.2	8,381,492	4.5
100 to 174 acres	42,579	157.2	6,693,347	42.6	94,550,858	51.0
175 to 259 acres	3,665	209.0	765,871	4.9	11,734,648	6.3
260 to 499 acres	4,929	341.6	1,683,514	10.7	24,192,713	13.1
500 to 999 acres	800	699.8	559,812	3.6	6,460,602	3.5
1,000 acres and over	581	9,316.3	5,412,784	34.4	37,096,626	20.0

[1] Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The Territory	$1,764	$220	$105	$877	$597	20.1
Under 3 acres	260	203	28	6,245	237	3.5
3 to 9 acres	257	184	33	211	146	21.3
10 to 19 acres	240	93	32	151	161	31.3
20 to 49 acres	421	93	41	179	191	26.0
50 to 99 acres	825	139	62	279	312	23.9
100 to 174 acres	1,445	198	96	482	458	20.6
175 to 259 acres	2,092	289	149	672	736	23.0
260 to 499 acres	3,083	407	201	1,217	1,047	21.3
500 to 999 acres	4,317	563	251	2,945	1,728	21.4
1,000 acres and over	27,018	945	363	35,524	10,214	16.0

Over two-thirds of all farms in the state belong to the medium-sized class—100 to 174 acres. The acreage of this group is about two-fifths and the value about one-half of the state total. Of the 581 farms containing 1,000 acres and over, 280 were operated by "part owners" and 108 by "managers," and of the total number 470 were "live-stock farms."

With a few exceptions, the average values of the several forms of farm property increase with the size of the farms. The high average value of live stock and large gross income for farms under 3 acres are due to the fact that most of this class are live-stock farms, whose operators use the public domain for range purposes, while others are dairy or truck farms. The incomes from these industries depend less upon the acreage of owned or rented land than upon the capital invested in buildings, implements, and live stock, and the amount expended for labor.

The average gross income per acre for the various groups classified by area is as follows: Farms under 3 acres, $118.55; 3 to 9 acres, $18.78; 10 to 19 acres, $10.13; 20 to 49 acres, $5.47; 50 to 99 acres, $4.02; 100 to 174 acres, $2.91; 175 to 259 acres, $3.52; 260 to 499 acres, $3.07; 500 to 999 acres, $2.47; 1,000 acres and over, $1.10.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading features of the statistics relating to farms classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop, and constitutes at least 40 per cent of the total value of products not fed to live stock, the farm is classified as a "hay and grain" farm. If vegetables are the leading crop, constituting 40.0 per cent of the value of such products, it is a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive 40.0 per cent of their income from any one class of farm products. Farms with no income in 1899 are classified according to the agricultural operations upon other farms in the same locality.

TABLE 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The Territory	62,495	251.5	15,719,258	100.0	$185,343,818	100.0

1 Less than one-tenth of 1 per cent.

TABLE 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The Territory	$1,764	$220	$105	$877	$597	20.1
Hay and grain	1,924	246	128	476	595	21.4
Vegetables	1,107	150	61	289	396	24.7
Fruit	1,763	363	93	340	604	23.6
Live stock	2,333	252	110	2,280	957	19.2
Dairy produce	1,103	154	69	664	192	9.7
Tobacco	1,520	363	105	554	430	16.9
Cotton	889	116	56	266	341	25.7
Sugar	1,394	804	82	372	327	12.8
Flowers and plants	1,793	1,643	142	14	1,150	32.0
Nursery products	2,693	648	121	105	2,936	82.3
Miscellaneous	1,151	169	75	367	321	18.2

For the several classes of farms the average values per acre of products not fed to live stock are as follows: Farms whose operators derive their principal income from flowers and plants, $251.56; nursery products, $28.54; fruit, $4.49; hay and grain, $3.24; cotton, $2.75; vegetables, $2.70; live stock, $1.86; tobacco, $1.69; sugar, $1.31; dairy products, $1.04; and miscellaneous, $2.13. In obtaining these averages the total acreage of each group was used and not the acreage in the crop from which the group is named.

The wide variations in the averages and percentages of gross income are largely due to the fact that in computing gross income no deductions are made for expenditures. Were it possible to present the average net income, the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by the reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The Territory	62,495	251.5	15,719,258	100.0	$185,343,818	100.0

$2,500 and over	12,072	820	412	13,655	9,516	35.3

Most of the farms reporting no income for 1899 were homesteads taken up too late for cultivation during that year. The facts that of the 2,777 farms in this class 2,029 were from 100 to 175 acres in size, and that 2,084 of them were operated by owners, sustain this view. There were some farms, also, from which no reports of the products of 1899 could be secured, as the persons in charge June 1, 1900, did not operate the farms during the preceding year and could give no information concerning the products of that year. To this extent the reports fall short of giving a complete exhibit of farm income in 1899.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the census of 1900. The age grouping for neat cattle was determined by their present and prospective relations to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits a very close comparison with the figures published in the Eleventh Census.

Table 14 presents a summary of live-stock statistics.

TABLE 14.—NUMBER OF DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age, in years.	ON FARMS.			NOT ON FARMS.
		Number.	Value.	Average value.	Number.
Calves	Under 1	300,125	$3,208,409	$10.69	1,353
Steers	1 and under 2	159,651	2,961,890	18.55	497
Steers	2 and under 3	191,340	4,550,770	23.78	97
Steers	3 and over	306,675	8,892,081	29.00	41
Bulls	1 and over	22,823	917,477	40.20	101
Heifers	1 and under 2	125,029	2,262,978	18.10	410
Cows kept for milk	2 and over	165,852	5,045,668	30.42	3,761
Cows and heifers not kept for milk.	2 and over	438,257	9,943,942	22.69	737
Colts	Under 1	26,933	423,331	15.72	374
Horses	1 and under 2	28,382	656,139	23.12	230
Horses	2 and over	248,316	9,535,824	38.40	15,084
Mule colts	Under 1	6,272	162,288	25.88	127
Mules	1 and under 2	6,751	252,457	37.40	88
Mules	2 and over	42,654	2,413,885	56.59	1,524
Asses and burros	All ages	1,521	124,171	81.64	129
Lambs	Under 1	22,823	39,255	1.72	14
Sheep (ewes)	1 and over	37,641	105,841	2.81	15
Sheep (rams and wethers).	1 and over	10,894	34,642	3.18	11
Swine	All ages	584,878	2,380,025	4.07	6,102
Goats	All ages	3,772	10,854	2.88	105
Fowls:[1]					
Chickens[2]		2,527,353	900,743		
Turkeys		86,460			
Geese		12,934			
Ducks		71,562			
Bees (swarms of)		1,910	6,998	3.66	
Value of all live stock			54,829,568		

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.
[2] Including Guinea fowls.

The total value of all live stock on farms, June 1, 1900, was $54,829,568, of which 59.7 per cent represents the value of neat cattle other than dairy cows; 19.4 per cent, that of horses; 9.2 per cent, that of dairy cows; 5.2 per cent, that of mules; 4.3 per cent, that of swine; and 2.2 per cent, that of all other live stock. No reports were secured of the value of live stock not on farms, but it is probable that such animals have higher average values than those on farms. Allowing the same averages, however, the total value of the domestic animals not on farms, given in Table 14, is $888,806. Exclusive of poultry and bees not on farms, the total value of live stock in the state is approximately $55,718,374.

CHANGES IN LIVE STOCK KEPT ON FARMS.

The following table shows the changes since 1890 in the numbers of the most important domestic animals:

TABLE 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS: 1890 AND 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	165,852	1,543,900	303,631	57,198	48,535	584,878
1890	16,756	110,199	25,554	4,923	16,565	21,962

[1] Lambs not included.

In the last decade the opening up and settlement of new lands have effected important changes in the numbers of all classes of live stock. In comparison with the figures of 1890, the census of 1900 reports, approximately, ten times as many dairy cows; fourteen times as many other neat cattle; twelve times as many horses, mules, and asses; three times as many sheep; and twenty-seven times as many swine.

Although in 1900 the enumerators were instructed to report no fowls under three months old, and in 1890 no such limitation was made, the later census shows, approximately, eighteen times as many geese, sixteen times as many ducks, fifteen times as many turkeys, and seven times as many chickens.

ANIMAL PRODUCTS.

Table 16 is a summarized statement of the products of the animal industry.

TABLE 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	278,425	$37,750
Mohair and goat hair	Pounds	693	187
Milk	Gallons	[1]47,439,853	} [2]2,481,673
Butter	Pounds	8,781,359	
Cheese	Pounds	45,264	
Eggs	Dozen	13,724,900	1,284,414
Poultry			1,302,460
Honey	Pounds	16,540	} 2,257
Wax	Pounds	400	
Animals sold			10,547,764
Animals slaughtered			2,925,846
Total value			18,582,351

[1] Comprises all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Comprises the value of milk sold and consumed, and of butter and cheese made.

The value of animal products in 1899 was $18,582,351, of which 72.5 per cent represents the value of animals sold and animals slaughtered on farms; 13.9 per cent, that of poultry and eggs; 13.4 per cent, that of dairy products; and 0.2 per cent, that of wool, mohair, honey, and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED ON FARMS.

Of all farmers reporting domestic animals, 35,702, or 59.2 per cent, reported animals slaughtered, the average value per farm being $81.95. Of all reporting domestic animals, 31,560, or 52.3 per cent, reported sales, the average receipts per farm being $334.21. The value of animals sold and animals slaughtered on farms was $13,473,610, or 36.1 per cent of the gross farm income. In obtaining these reports the enumerators were instructed to secure from each farm operator a statement of the amount received from sales in 1899, less the amount paid for animals purchased the same year.

DAIRY PRODUCE.

The production of milk in 1899 was 47,439,853 gallons, thirty times as great as ten years before. There were made on farms in 1899 nearly twenty-three times as much butter, and more than twenty-eight times as much cheese, as ten years before.

Of the $2,481,673 given in Table 16 as the value of dairy products, $1,821,125, or 73.4 per cent, represents the value of such products consumed on farms, and $660,548, or 26.6 per cent, the receipts from sales of dairy products. Of the latter amount, $358,347 was received from the sale of 2,806,790 pounds of butter; $293,976, from 2,701,471 gallons of milk; $4,969, from 8,434 gallons of cream; and $3,256, from 30,628 pounds of cheese.

POULTRY, EGGS, WOOL, HONEY, AND WAX.

The total value of the products of the poultry industry in 1899 was $2,586,874, of which 50.3 per cent represented the value of poultry raised, and 49.7 per cent, the value of eggs produced. There were 13,724,900 dozen eggs produced in 1899, nearly fourteen times the number reported in 1890.

More than four times as much wool was reported in 1900 as in 1890, and the average weight of fleeces increased from 4.8 pounds in 1890 to 5.4 pounds in 1900.

In 1899, 16,540 pounds of honey were produced, almost six times as much as ten years before, and 400 pounds of wax, sixteen times the product of 1889.

HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses and dairy cows, the total number of these animals, and the average number per farm. In computing the averages presented, only those farms which report the kind of stock under consideration are included.

TABLE 17.—HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.			DAIRY COWS.		
	Farms reporting.	Number.	Average per farm.	Farms reporting.	Number.	Average per farm.
Total	56,574	303,631	5.4	46,559	165,852	3.6
White farmers	53,946	280,668	5.2	45,335	163,196	3.6
Colored farmers	2,628	22,963	8.7	1,224	2,656	2.2
Owners[1]	44,989	244,052	5.4	37,767	139,443	3.7
Managers	246	5,507	22.4	164	693	4.2
Cash tenants	4,476	24,931	5.6	3,611	12,369	3.4
Share tenants	6,863	29,141	4.2	5,017	13,347	2.7
Under 20 acres	537	2,062	3.8	329	828	2.5

Fruit	141	548	3.9	104	315	3.0
Live stock	14,236	100,489	7.1	12,731	56,049	4.4
Dairy	3,013	14,329	4.8	3,238	18,131	5.6
Cotton	5,599	16,112	2.9	4,293	12,690	3.0
Miscellaneous[2]	7,434	28,192	3.8	6,185	19,385	3.1

[1] Including "part owners" and "owners and tenants."
[2] Including tobacco farms, sugar farms, florists' establishments, and nurseries.

CROPS.

The following table gives the statistics of the principal crops of 1899:

TABLE 18.—ACREAGES, QUANTITIES, AND VALUES OF THE PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantity.	Value.
Corn	1,320,506	Bushels	38,239,880	$8,699,271
Wheat	1,279,826	Bushels	18,124,520	8,989,416
Oats	156,619	Bushels	5,087,930	1,079,862
Barley	16,453	Bushels	346,730	80,153
Rye	3,501	Bushels	41,220	16,519
Buckwheat	13	Bushels	170	100
Kafir corn	63,455	Bushels	1,110,473	228,401
Flaxseed	759	Bushels	5,050	4,562
Clover seed		Bushels	178	728
Grass seed		Bushels	3,752	2,021
Hay and forage	695,313	Tons	1,146,455	2,883,682
Cotton	240,678	Pounds	36,006,020	2,217,119
Cottonseed		Tons	29,207	250,815
Tobacco	39	Pounds	11,880	1,531
Broom corn	12,366	Pounds	3,418,490	129,813
Peanuts	2,077	Bushels	47,280	27,642
Castor beans	13,997	Bushels	77,185	68,842
Dry beans	590	Bushels	4,353	5,000
Dry pease	171	Bushels	1,911	1,856
Potatoes	7,677	Bushels	559,532	288,117
Sweet potatoes	2,512	Bushels	195,799	96,040
Onions	434	Bushels	58,456	39,958
Miscellaneous vegetables	20,828			865,857
Sorghum cane	9,788	Tons	25,327	69,007
Sorghum sirup		Gallons	81,891	24,825
Small fruits	810			63,519
Orchard fruits[1]	114,700	Bushels		[2]245,990
Grapes[1]	5,060	Centals	61,110	[3]128,500
Nuts				352
Forest products				252,951
Flowers and plants	9			6,574
Seeds	169			4,825
Nursery products	711			84,437
Miscellaneous	2,248			17,108
Total	3,971,309			26,865,393

[1] Estimated from number of vines or trees.
[2] Including value of cider and vinegar.
[3] Including value of wine, raisins, etc.

Of the total value of crops, cereals, including Kafir corn, contributed 71.1 per cent; hay and forage, 10.7 per cent; cotton, including seed, 9.2 per cent; vegetables, including potatoes, sweet potatoes, and onions, 4.8 per cent; fruit, 1.6 per cent; and all other crops, 2.6 per cent.

The average values per acre of the various crops were as follows: Flowers and plants, $730.44; nursery products, $118.76; onions, $92.07; small fruits, $78.42; miscellaneous vegetables, $41.57; tobacco, $39.26; sweet potatoes, $38.23; potatoes, $37.53; seeds, $28.55; grapes, $25.40; peanuts, $13.31; broom corn, $10.50; cotton, $10.25; beans and pease, $9.01; and cereals, $6.72.

COTTON.

But three counties, Canadian, Cleveland, and Greer, reported cotton in 1889. The number of acres seeded to the crop in that year was 1,109, and the quantity of cotton produced was 202,725 pounds, an average of 183 pounds per acre.

In 1899, 16,316 farmers devoted an area of 240,678 acres to the production of cotton, an average of 14.8 acres per farm. From this land was obtained 36,006,020 pounds of cotton, an average of 2,207 pounds per farm, and 150 pounds per acre. The total value of this crop, including the value of the cottonseed, was $2,467,934, an average of $151.26 per farm, and $10.25 per acre. This value constituted 6.6 per cent of the gross farm income.

The counties having the largest area under cotton in 1899 were Lincoln, Pottawatomie, Cleveland, and Greer, ranking in the order named, and reporting, in the aggregate, 65.3 per cent of the total acreage. These counties are located in the central and extreme southwestern parts of the territory.

CEREALS.

The following table is a statement of the changes in cereal production since 1889:

TABLE 19.—ACREAGE AND PRODUCTION OF CEREALS: 1889 AND 1899.

PART 1.—ACREAGE.

YEAR.	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	16,453	13	1,320,506	156,619	3,501	1,279,826
1889	17		13,307	4,446	110	2,003

PART 2.—BUSHELS PRODUCED.

YEAR.	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	346,730	170	38,239,880	5,087,930	41,220	18,124,520
1889	112		234,315	76,194	1,052	30,175

The total area devoted to cereals in 1889 was 19,883 acres; and in 1899, 2,776,918 acres. The increases in the acreages devoted to cereals in the decade from 1889 to 1899 were very rapid, the gains ranging from over thirty to nearly one thousand fold. The total number of bushels produced in 1889 was 341,848, while the production in 1899 was 61,840,450 bushels, or more than 180 times as great.

Of the total area under cereals in 1899, 47.6 per cent was devoted to corn; 46.1 per cent, to wheat; and 6.3 per cent, to oats, barley, rye, and buckwheat.

Corn was extensively raised in 1899, Woods county alone producing 4,521,110 bushels. Grant, Lincoln, Payne, Kay, and Garfield counties, and the Osage and Kaw Indian reservations, each reported over 2,000,000 bushels, and 10 others, each over 1,000,000 bushels. Wheat was grown in nearly all counties, those in the Arkansas River valley showing the largest returns. Oats, barley, and rye were produced in large quantities in the Cimarron and Canadian River valleys, but very little attention was given to buckwheat.

Kafir corn was grown in 1899 by 4,747 farmers on 63,455 acres, an average of 13.4 acres for each farm reporting. From this area was obtained a yield of 1,110,473 bushels, or an average of 17.5 bushels per acre. The total value of the crop was $228,401, an average of $48.11 for each farm reporting. The average value per bushel was $0.21, and the average value per acre was $3.60. The crop was grown in all parts of the territory, but 37.3 per cent of the entire acreage was furnished by the two counties of Greer and Woods.

HAY AND FORAGE.

In 1900, 36,693 farmers, or 58.7 per cent of the total number, reported hay and forage crops. Exclusive of cornstalks, they obtained an average yield of 1.6 tons per acre. The total acreage in hay and forage for 1899 was 695,313 acres. Of this acreage, 336,977 acres, or 48.5 per cent, produced 368,121 tons of wild, salt, and prairie grasses. The acreages and yields of the other kinds of hay and forage were as follows: Millet and Hungarian grasses, 33,327 acres and 60,788 tons; alfalfa or lucern, 15,116 acres and 27,563 tons; clover, 343 acres and 480 tons; other tame and cultivated grasses, 9,395 acres and 11,975 tons; grains cut green for hay, 25,039 acres and 58,446 tons; crops grown for forage, 275,116 acres and 609,923 tons; and cornstalks, 9,768 acres and 8,159 tons.

In Table 18 the production of cornstalks is included under "hay and forage," but the acreage is included under "corn," as the forage secured was an incidental product of the corn crop.

ORCHARD FRUITS.

The changes in orchard fruits since 1889 are shown in the following table:

TABLE 20.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900	1890	1899	1889
Apples	2,054,894	265	111,235	....
Apricots	231,268	....	493	....
Cherries	404,758	30	1,766	....
Peaches	5,519,072	206	255,933	....
Pears	177,265	4	1,968	....
Plums and prunes	403,317	214	7,986	49

The number of trees reported in the territory in 1889 was only 719, while in 1899 this number had increased to 8,962,971. In 1900, 61.6 per cent of all fruit trees were peach trees; 22.9 per cent, apple trees; 4.5 per cent, cherry trees; 4.5 per cent, plum and prune trees; 2.6 per cent, apricot trees; and 3.9 per cent, pear, and unclassified trees.

A large percentage of the apples grown was reported in Payne, Lincoln, and Pottawatomie counties, in the southeastern part of the territory. Peaches are reported by 37,125 farmers, or 59.4 per cent of the total. Nearly one-half of the trees are in the four north central counties of Woods, Garfield, Grant, and Logan. These counties also report very large percentages of each of the remaining varieties.

In addition to the trees shown in Table 20, unclassified orchard trees to the number of 172,397 are reported, with a yield of 1,136 bushels. The value of orchard products given in Table 18 includes the value of 646 barrels of cider, 519 barrels of vinegar, and 14,350 pounds of dried and evaporated fruits.

SORGHUM CANE.

The present census shows that in 1899 sorghum cane was raised by 2,367 farmers on 9,788 acres, an average of 4.1 acres for each farm reporting. From this area 25,327 tons of cane were sold for $59,007, and from the remaining product 81,891 gallons of sirup, valued at $24,825, were manufactured. This was an increase in acreage since 1889 of 8,944 acres, or over tenfold, and in production of 50,592 gallons, or 161.6 per cent, not including the product of the 25,327 tons of cane sold. The total value of the sorghum cane products was $83,832, an average for each farm reporting of $35.42. The average value per gallon was $0.30. The crop was grown in 25 counties and reservations, Greer county leading with an area of 1,574 acres.

CASTOR BEANS.

Castor beans were grown in 1899 by 1,296 farmers, who devoted to their cultivation 13,997 acres, and secured therefrom a product of 77,185 bushels, an average of 5.5 bushels per acre. Of the total acreage, 94.0 per cent was reported from the central and eastern counties of Payne, Dewey, Lincoln, Pawnee, Logan, Garfield, Noble, and Custer, ranking in the order named.

VEGETABLES.

The total area devoted to vegetables in 1899, including potatoes, sweet potatoes, and onions, was 31,451 acres. Aside from the land devoted to potatoes, sweet potatoes, and onions, 20,828 acres were used in the growing of miscellaneous vegetables. Of this area, the products of 12,077 acres were not reported in detail. Of the remaining 8,751 acres, 4,469 acres were devoted to watermelons; 1,371, to muskmelons; 1,019, to sweet corn; 864, to cabbages; 690, to tomatoes; 263, to cucumbers; and 75, to other vegetables.

SMALL FRUITS.

The total area used in the growing of small fruits was 810 acres. Of this area, 620 acres, or 76.5 per cent, were devoted to blackberries and dewberries, the total production of which was 646,320 quarts. The acreages and productions of the other berries were as follows: Strawberries, 124 acres and 197,290 quarts; raspberries and Logan berries, 35 acres and 42,530 quarts; currants, 10 acres and 9,720 quarts; gooseberries, 8 acres and 7,550 quarts; and other berries, 13 acres and 13,300 quarts.

FLORICULTURE.

Floriculture in Oklahoma, as in all new states and territories, is a relatively unimportant industry. In 1899 the operators of 17 farms raised flowers and foliage plants valued at $6,574, but of this number only 7 derived their principal income from this source. These 7 commercial florists had a gross income of $8,050, of which $5,900 was derived from flowers and plants, and $2,150, from other products. The capital invested was $25,145; of which $12,550 was in land; $11,500, in buildings; $995, in implements; and $100, in live stock. The expenditure for labor was $800.

In addition to the 7 principal florists' establishments, 23 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 5,598 square feet, making, with the 20,422 square feet belonging to the florists' establishments, 26,020 square feet.

NURSERIES.

The total value of nursery stock sold in 1899 was $84,437, reported by the operators of 78 farms and nurseries. Of this number, 26 derived their principal income from the nursery business. They had 2,675 acres of land, valued at $70,015; buildings worth $16,835; implements and machinery valued at $3,159; and live stock worth $2,730. Their total gross income was $76,333, of which $72,743 was derived from the sale of trees, shrubs, and vines, and $3,590 from the sale of other farm products.

LABOR.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $2,359,650, an average of $38 per farm. The average was highest on the most intensively cultivated farms, being $455 for nurseries, $114 for florists' establishments, $51 for live-stock farms, $47 for hay and grain farms, $45 for fruit farms, $26 for sugar farms, $16 for vegetable farms, $10 for dairy and tobacco farms, and $9 for cotton farms. "Managers" expended on an average $689; "cash tenants," $58; "owners," $27; and "share tenants," $18. White farmers expended $39 per farm, and colored farmers, $9.

INDIAN RESERVATIONS.

The Indians of Oklahoma represent several linguistic stocks and many different tribes, having been collected from adjoining states and even remote regions. The Kiowa, Comanche, and a small band of Apache are the only native tribes of this locality. The lands of the following bands have been allotted and the surplus opened to settlement: Cheyenne and Arapaho, Iowa and Tonkawa, Mexican, Kickapoo, Tonkawa and Lipan, Pawnee, Absentee Shawnee and Potawatomi, Ottawa, Sac and Fox of the Missouri and Mississippi. There were still six reservations intact when the Twelfth Census was taken, Osage, Kaw, Ponca, Otoe, Wichita, and Kiowa and Comanche. The two last-named, however, have since been allotted and thrown open. Much of the Indian land is suitable either for cultivation or grazing and some Indians have made fair progress in the development of their allotments, but annuity payments and the returns from leased land have allowed many of them to live in idleness, and comparatively little attention is devoted to agriculture.

OSAGE AND KAW RESERVATIONS.

Osage reservation, embracing an area of 2,297 square miles, is situated in the extreme northeastern part of Oklahoma. Kaw, which adjoins it on the northwest, was formerly a portion of the Osage reserve and contains 156¼ square miles. The land included within these tracts was originally purchased by the Osage from the Cherokee of Indian Territory. The river bottoms and small valleys contain fine tracts of farming land, while the prairies and upland hills yield abundant prairie grass, thus making an excellent grazing country of vast extent.

The Osage (Siouan) are the largest, physically, and also the wealthiest Indians in the United States. The population of their reserve is 6,717, of which only about about one-third is Indian. Farming and stock raising have been their only occupations, but they have too much money to put any energy into agriculture, the majority preferring to live at the village in idleness. Their income from annuity payments and from farming and grazing leases amounts to over $200 per man, woman, and child. Nearly every family has one or more farms rented to white men. The full bloods are still "blanket Indians" to a large extent, and very nonprogressive, although many can speak English. The mixed bloods, however, are more industrious, having well kept farms and stock. All speak English and have a common school education, while some of them are wealthy. Annuity payments furnish 92.0 per cent of the support of the Osage.

The Kaw, also of Siouan stock, are no more progressive than their neighbors, although they have to work to some extent, as they receive much less annuity money. Most of their farms are rented out and many of them live in idleness. The total population of the reserve is 768, of which number less than one-third is Indian. Annuity payments constitute 75.0 per cent of their support.

Corn and wheat are the principal crops of the Osage and Kaw, and wild hay is cut in large quantities. Some farmers also raise Kafir corn, millet, and Hungarian grasses, and a few have small areas in sorghum cane. A number grow potatoes and small fruits, but vegetable gardens are not general. Orchards of apple, peach, pear, plum, and cherry trees are quite common among these Indians, and some cultivate grapes.

Of the 960 farms on the two reservations, only 133 are operated by Indians. The majority of Indian farmers cultivated from 50 to 300 acres, and one had 900 acres under cultivation. No allotments have been made on either reserve, and several intelligent Indians have taken advantage of this fact to occupy extensive tracts and enjoy the profits derived from their cultivation.

Most Indian farmers are well supplied with horses and cattle, and many own mules. A number have large herds of range cattle, and reported sales of live stock from \$1,000 to \$3,000. Dairy cows are found on the majority of farms, and on some, chickens and swine.

PONCA AND OTOE RESERVATIONS.

Ponca and Otoe reservations are situated in Noble county, in the northeastern part of Oklahoma, and contain 159 and 201⅝ square miles, respectively. The greater part of the former and more than one-half of the latter has been allotted. About nine-tenths of the Ponca and eight-tenths of the Otoe reserves are cultivable, as the land is largely prairie, with a rich, well-watered soil, peculiarly adapted to wheat raising and suitable for cotton.

The Ponca, of Siouan stock, are agriculturists, but as they can readily lease their lands few have any desire to labor. The only perceptible progress seems to be in house building and many now have good homes with furniture, cooking utensils, and other modern conveniences. The population of the reserve is 1,537, of which a little more than one-third is Indian.

The crops of the Ponca, Otoe, and Missouri are corn and wheat, and large quantities of wild prairie grass are cut. Many of the white tenants raised sorghum cane, and Kafir corn for forage, while some cultivated large areas of broom corn. Only 39 of the 256 farms on these two reserves were operated by Indians, an evidence of the prevalent leasing system. The majority of Indian farmers cultivated from 15 to 30 acres.

The Indian farmers owned no cattle, their live stock consisting principally of work horses.

WICHITA, KIOWA, AND COMANCHE RESERVATIONS.

Wichita, Kiowa, and Comanche reservations, which have been allotted and opened to settlement since 1900, are located in the extreme southern part of Oklahoma and adjoin the Chickasaw Nation on the west. Wichita, the more northern of the two, comprises an area of 1,162 square miles, while Kiowa and Comanche contains 4,639 square miles. This is the most extensive grazing section of Oklahoma, embracing immense prairies, well watered and covered with native grasses, which will withstand a long drought. Walled valleys among the Kiowa mountains also furnish an excellent winter range, and large areas of grazing land are leased to white cattlemen. This tract is not generally adapted to cultivation, although fine farms are found in the bottom lands along streams. The soil is well suited to cotton, but only a very little of it has ever been grown, as the prevailing hot winds of summer and the uncertainty of rainfall are greatly detrimental to successful agriculture.

The Wichita (Pani Caddoan), with a few small bands of affiliated tribes, live on the reservation bearing that name, which has a population of 1,420, about one-third of which is Indian. Having been largely dependent upon their own efforts for support, they are peaceable and more industrious than their neighbors, the Kiowa and Comanche, who, with a small band of Apache (Athapascan) and Delaware (Algonquian), inhabit the Kiowa and Comanche Reservation, which has a total population of 4,968, two-thirds Indian.

Agriculture and stock raising are the principal industries carried on by the tribes on these two reservations, while a few are engaged in freighting Government supplies. The Wichita are the best farmers, and some who raise cattle are now able to support themselves from the returns of their sales of live stock. Fort Sill and the agency furnish a market for their principal crops, consisting of corn, prairie grass, millet, and Kafir corn. The latter will mature on the uplands where the drought would kill Indian corn, and is considered excellent forage. Some reported small areas in sweet potatoes, melons, and sweet corn, but garden vegetables are not generally raised. Considerable interest is taken in stock raising, and all Indian farmers own some range cattle, but few have dairy cows. A number are exclusively engaged in the industry and have acquired large herds. All have more Indian ponies than necessary, and a few farmers raise chickens and swine. There were 459 farms on the two reserves, of which 285 were operated by Indians. The majority of them cultivated from 10 to 70 acres, while a few had over 100 acres in cultivation.

IRRIGATION STATISTICS.

In the territory of Oklahoma the necessity for irrigation is not so imperative as in other states and territories near the one-hundredth meridian. The areas artificially watered in 1899 were principally confined to the counties in the extreme northwestern part of the territory.

More than one-half of the irrigated area is in Beaver county, a long, narrow strip of land extending west of the main part of the territory, across the northern end of the Texas Panhandle and bounded by Kansas, Colorado, New Mexico, and Texas. The Cimarron River, which rises in the mountains in the northeastern part of New Mexico, flows across the northwestern end of the county into Kansas. A number of ditches are taken out of the main stream and its tributaries. The principal branch of the Cimarron used for irrigation is Beaver Creek, which rises just over the border line of New Mexico, and flows in a general easterly direction through the center of Beaver county, and diagonally across Woodward county. This stream and its numerous spring-fed branches furnish an ample supply of water to the ditches taken from them. Its valley is narrow, but fertile, and the soil, when watered, is well adapted to the cultivation of all crops of the temperate zone.

The total acreage irrigated in the territory in 1899 was 2,759 acres. Of this, 139 acres were irrigated from wells by the use of pumping plants costing $2,200. The remaining 2,620 acres were irrigated from streams. The principal crops grown on this land were alfalfa and vegetables, with some fruits.

The following table shows, by counties, the number of irrigators, the number of acres irrigated from streams and wells in 1899, the value of irrigated and unirrigated arable land, and the number, length, and cost of construction of ditches:

TABLE A.—NUMBER OF IRRIGATORS, AND NUMBER OF ACRES IRRIGATED FROM STREAMS AND WELLS IN 1899, WITH VALUE OF IRRIGATED AND UNIRRIGATED ARABLE LAND, AND NUMBER, LENGTH, AND COST OF CONSTRUCTION OF DITCHES.

COUNTIES.	Number of irrigators.	ACRES IRRIGATED.			AVERAGE VALUE OF ARABLE LAND PER ACRE.		DITCHES.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 231. WASHINGTON, D. C. July 5, 1902.

AGRICULTURE.

WASHINGTON.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

SIR: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the state of Washington, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land under one management, used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It includes also the house in which the farmer resides, and all other buildings used by him in connection with his farming operations.

The farms of Washington, June 1, 1900, numbered 33,202, and were valued at $115,609,710. Of this amount, $16,299,200, or 14.1 per cent, represents the value of buildings; and $99,310,510, or 85.9 per cent, the value of the land and improvements other than buildings. On the same date the value of farm implements and machinery was $6,271,630, and of live stock, $22,159,207. These values added to that of farms give $144,040,547, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of such products, together with the value of all crops, is termed, "total value of farm products." This value for 1899 was $34,827,495, of which amount $11,295,345, or 32.4 per cent, represents the value of animal products, and $23,532,150, or 67.6 per cent, the value of crops, including forest products cut or produced on farms. The "total value of farm products" for 1899 exceeds that for 1889 by $21,152,565, or 154.7 per cent, but a part of this gain is doubtless due to a more detailed enumeration in 1900 than in 1890.

The "gross farm income" is obtained by deducting from the total value of farm products the value of the products fed to live stock on the farms of the producers. In 1899 the reported value of products fed was $5,209,040, leaving $29,618,455 as the gross farm income for that year. The ratio which this amount bears to the "total value of farm property" is referred to in this bulletin as the "percentage of gross income upon investment." For Washington in 1899 it was 20.6 per cent.

As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

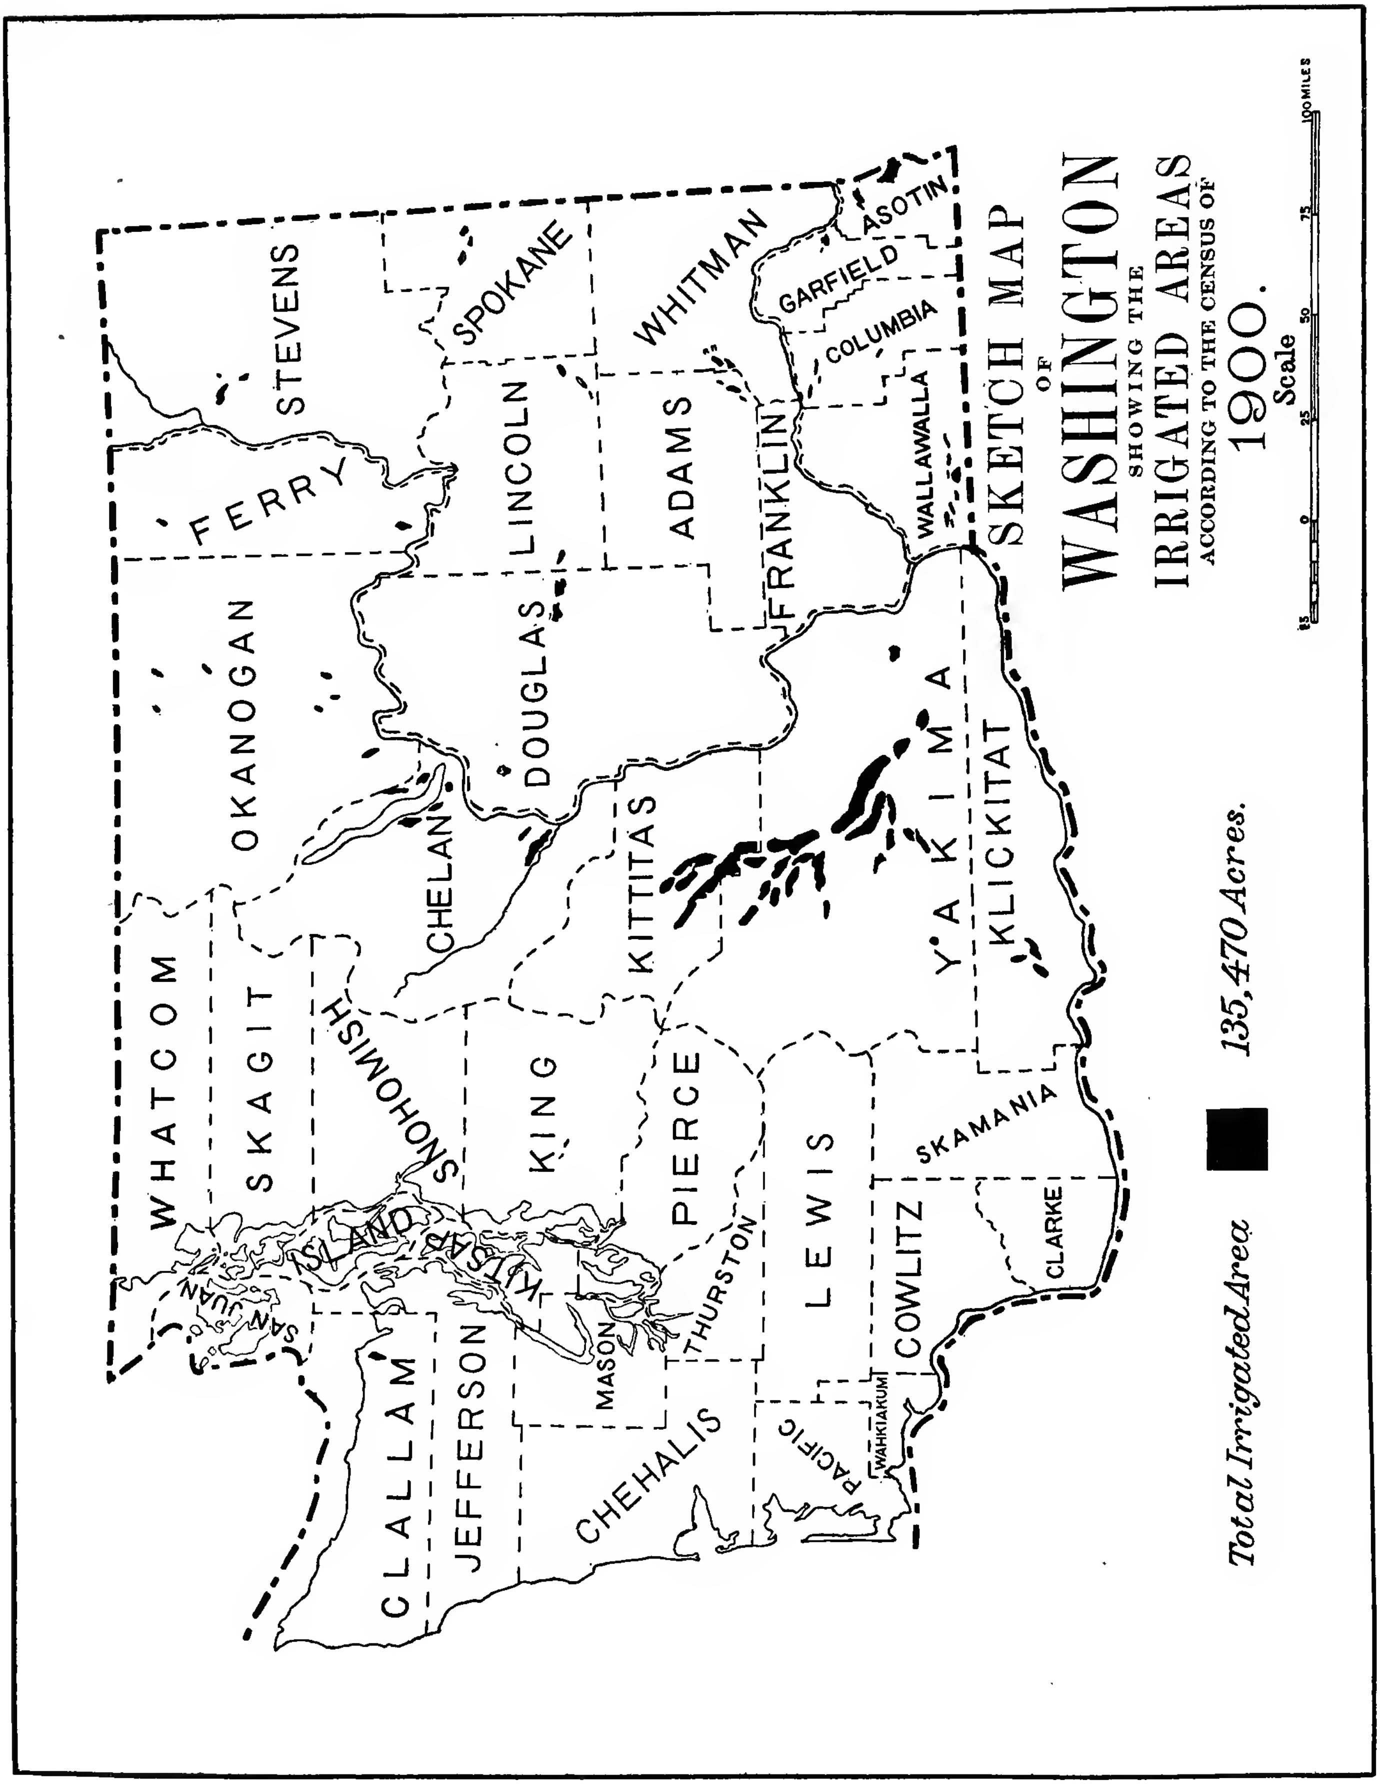
Special reports as to the dimensions and cost of the leading irrigation ditches and canals, the area of land under them, methods for the artificial application of water to the growing crops, and other facts relating to irrigation were obtained by correspondence with farmers, engineers, and others. This correspondence was under the joint direction of Mr. F. H. Newell, chief hydrographer of the Geological Survey, acting as expert special agent for the division of agriculture, and Mr. Clarence J. Blanchard.

The statistics presented in this bulletin will be treated in greater detail in the report on agriculture in the United States. The present publication is designed to present a summarized advance statement for Washington.

Very respectfully,

L. G. Powers.

Chief Statistician for Agriculture.



SKETCH MAP OF WASHINGTON SHOWING THE IRRIGATED AREAS ACCORDING TO THE CENSUS OF 1900.

AGRICULTURE IN WASHINGTON.

GENERAL STATISTICS.

Washington has a total land area of 66,880 square miles, or 42,803,200 acres, of which 8,499,297 acres, or 19.9 per cent, are included in farms.

The state of Washington comprises two natural divisions. Eastern Washington, through which the Columbia River flows, includes all that portion of the state lying east of the Cascade Range. It is, in great part, composed of rolling plateaus, rising from its lowest portion, along the Columbia and Snake rivers, at an elevation of from 300 to 700 feet above sea level, to altitudes of 2,000 feet along the eastern boundary. The soil of this part of the state is generally of volcanic origin and very productive. The rainfall is not heavy, but commonly sufficient for agriculture without irrigation.

Western Washington differs widely in topography and climate from eastern Washington. The arable lands lie in a depression between the Cascade Range on the east and the Coast Range and Olympic Mountains on the west, a depression comprising Puget Sound and the valleys of Cowlitz, Clark and other rivers. The whole of western Washington enjoys an ample rainfall and is heavily forested.

NUMBER AND SIZE OF FARMS.

The following table gives, by decades since 1860, the number of farms, the total and average acreage, and the per cent of farm land improved.

TABLE 1.—FARMS AND FARM ACREAGE: 1860 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	33,202	8,499,297	3,465,960	5,033,337	256.0	40.8
1890	18,056	4,179,190	1,820,832	2,358,358	231.5	43.6
1880	6,529	1,409,421	484,346	925,075	215.9	34.4
1870	3,127	649,139	192,016	457,123	207.6	29.6
1860	1,330	366,156	81,869	284,287	275.3	22.4

Between 1860 and 1900 the number of farms increased rapidly, the rate for the last decade being 83.9 per cent. The total area in farms is over twenty-three times as great as it was forty years ago, and more than double that of 1890. Since 1870 there has been a steady increase in the average size of farms, which is especially marked in the last decade, but this is largely the result of additions made to ranges, recently taken from the public domain and enumerated as farm land for the first time in 1900. The gain in the percentage of farm land improved has been continuous throughout the period except in the last decade, for which a decrease is shown. This decrease is doubtless the result of a stricter construction of the term "improved land" in 1900 than heretofore, as the increased acreage devoted to all crops indicates that there has been an increase in the acreage actually improved.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1860.

TABLE 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY AND OF FARM PRODUCTS: 1860 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$144,040,547	$115,609,710	$6,271,630	$22,159,207	$34,827,495
1890	100,724,970	83,461,660	3,150,200	14,113,110	13,674,930
1880	19,655,044	13,844,224	958,513	4,852,307	4,212,750
1870[2]	6,362,235	3,978,341	280,551	2,103,343	[3]2,111,902
1860	3,508,155	2,217,842	190,402	1,099,911	....

[1] For year preceding that designated.
[2] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other years they must be diminished one-fifth.
[3] Includes betterments and additions to live stock.

As shown in the above table, there has been a remarkable increase in the value of every form of farm property from 1860 to 1900. In the last decade the gain in the total value of farm property was $43,315,577, or 43.0 per cent. The increase in value of land, improvements, and buildings was $32,148,050, or 38.5 per cent; in that of implements and machinery, $3,121,430, or 99.1 per cent; and in that of live stock, $8,046,097, or 57.0 per cent. The value of farm products shown for 1900 is 154.7 per cent greater than that reported for 1889, but a portion of this increase is doubtless due to the fact that the enumeration of 1900 was more detailed and complete than that made by any previous census. The most important item enumerated in 1900, but not in 1890, is the value of animals sold and animals slaughtered on farms, which for 1899 amounted to $4,685,855.

COUNTY STATISTICS.

Table 3 gives a statement of general agricultural statistics by counties.

TABLE 3.—NUMBER AND ACREAGE OF FARMS, AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH VALUE OF PRODUCTS OF 1899 NOT FED TO LIVE STOCK, AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Value of products not fed to live stock.	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.
The State	33,202	32,222	8,499,297	3,465,960	$99,310,510	$16,299,200	$6,271,630	$22,159,207	$29,618,455	$5,280,190	$29,165
Adams	783	747	494,452	275,778	3,557,850	328,100	262,090	612,971	746,859	137,640	...

[1] Indian reservation.

The number of farms increased in the last decade in all counties except Columbia and Garfield. In over one-half of the counties more than twice as many farms were reported. Kitsap county alone reports a decrease in its total farm area, all others showing substantial gains since 1890. The decrease reported in improved acreage in a few counties is due to the use of a more strict construction of the term "improved land" by the Twelfth than by any preceding census. The average size of farms for the state is 256.0 acres, and varies from 65.3 acres in Kitsap county to 1,664.7 acres in Franklin county. The average size of farms is largest in the eastern counties, where cereals and stock raising are the leading agricultural pursuits. Two-thirds of the counties report increases in the value of farms in the last ten years. Of the counties reporting decreases only one is situated in the eastern part of the state. The average value of farms for the state is $3,482.

Marked increases are reported for all counties except Kitsap in the value of implements and machinery, and decreases in the value of live stock are reported for only the three eastern counties of Columbia, Garfield, and Spokane.

The expenditure for labor in 1899 averaged $159.03 per farm. In the live-stock and cereal counties, the average was, as a rule, much higher than in the western counties, where diversified farming prevails.

FARM TENURE.

Table 4 gives a comparative statement of farm tenure for 1880, 1890, and 1900. The farms operated by tenants are divided into two groups, designated as farms operated by "cash tenants," who pay a rental in cash or a stated amount of labor or farm produce, and "share tenants," who pay as rental a stated share of the products.

In Table 5 the tenure of farms for 1900 is given by race of farmer, and farms operated by owners are subdivided into 4 groups, designated as "owners," "part owners," "owners and tenants," and "managers." These terms denote, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or part of it, and the other or others owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive for their supervision and other services a fixed salary from the owners.

TABLE 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURE: 1880 TO 1900.

YEAR.	Total number of farms	NUMBER OF FARMS OPERATED BY—			PER CENT OF FARMS OPERATED BY—		
		Owners.[1]	Cash tenants.	Share tenants.	Owners.[1]	Cash tenants.	Share tenants.
1900	33,202	28,425	2,341	2,436	85.6	7.1	7.3
1890	18,056	16,529	541	986	91.5	3.0	5.6
1880	6,529	6,058	209	262	92.8	3.2	4.0

[1] Including "part owners," "owners and tenants," and "managers."

TABLE 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURE, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

PART 1.—NUMBER OF FARMS OF SPECIFIED TENURE.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	33,202	24,327	3,499	194	405	2,341	2,436
White	32,112	23,346	3,485	191	403	2,271	2,416
Colored	1,090	981	14	3	2	70	20
Chinese	69	3	2			59	5
Indian	966	934	8	3	1	7	13
Negro	55	44	4		1	4	2

PART 2.—PER CENT OF FARMS OF SPECIFIED TENURE.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	100.0	73.3	10.5	0.6	1.2	7.1	7.3
White	100.0	72.7	10.8	0.6	1.3	7.1	7.5
Colored	100.0	90.0	1.3	0.3	0.2	6.4	1.8

The total number of farms increased 26,673, or 408.5 per cent, in the last two decades. Since 1890 the farms operated by owners increased 11,896, or 72.0 per cent; farms operated by cash tenants, 1,800, or 332.7 per cent; and farms operated by share tenants, 1,450, or 147.1 per cent. This increase has been continuous through both decades, but was greater for cash tenants than for owners or share tenants, showing a growing sentiment in favor of the cash payment system.

Of the total number of farms, 96.7 per cent are operated by white farmers and 3.3 per cent by colored farmers. Of the white farmers, 84.1 per cent own all or part of the farms they operate. For colored farmers the corresponding per cent is 91.6, as most of them are Indians who have received allotments from the Government.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the number of farms conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

Tables 6 and 7 present the principal statistics for farms classified by race of farmer and by tenure.

TABLE 6.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	33,202	256.0	8,499,297	100.0	$144,040,547	100.0
White farmers	32,112	260.9	8,378,339	98.6	141,831,986	98.5
Negro farmers	55	145.6	8,008	0.1	131,227	0.1
Indian farmers	966	115.1	111,180	1.3	1,847,635	1.3
Chinese farmers	69	25.7	1,770	(1)	229,699	0.1
Owners	24,327	191.1	4,648,740	54.7	85,300,698	59.2
Part owners	3,499	651.6	2,279,953	26.8	29,038,242	20.2
Owners and tenants	194	362.3	70,295	0.8	1,198,362	0.8
Managers	405	922.2	373,499	4.4	5,242,025	3.6
Cash tenants	2,341	199.5	467,076	5.5	9,468,044	6.6
Share tenants	2,436	270.8	659,734	7.8	13,793,176	9.6

[1] Less than one-tenth of 1 per cent.

TABLE 7.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY RACE OF FARMER AND BY TENURE.

RACE OF FARMER, AND TENURE.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$2,991	$491	$189	$667	$892	20.6
White farmers	3,052	501	191	672	911	20.6
Negro farmers	1,696	307	72	311	323	13.5
Indian farmers	1,025	187	123	578	274	14.3
Chinese farmers	2,911	217	83	118	1,090	32.7
Owners	2,335	460	155	556	714	20.4
Part owners	6,048	659	394	1,198	1,769	21.3
Owners and tenants	4,458	624	276	819	1,303	21.1
Managers	8,403	1,402	382	2,756	2,133	16.5
Cash tenants	2,802	428	129	685	847	20.9
Share tenants	4,315	458	248	641	1,213	21.4

While colored farmers constitute 3.3 per cent of the total number in the state, they occupy but 1.4 per cent of the total area, and the farms they operate constitute but 1.5 per cent of the total value of farm property.

The average values of farm property and products and the per cent of gross income are very much lower for Indian and negro farmers than for white farmers, but the averages and percentages are high for Chinese farmers, as most of their farms are intensively cultivated market gardens.

Of the groups by tenure, the averages are generally highest for managers, but as a result of these high values the per cent of gross income is lowest. Many of these farms are large grain farms and cattle ranches, while some are operated by the state and county authorities in connection with eleemosynary and reformatory institutions.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	33,202	256.0	8,499,297	100.0	$144,040,547	100.0
Under 3 acres	358	2.1	745	(1)	731,892	0.5
3 to 9 acres	1,056	6.5	6,848	0.1	1,494,718	1.0
10 to 19 acres	1,611	13.0	20,878	0.3	2,683,183	1.9
20 to 49 acres	4,240	34.1	144,567	1.7	8,005,016	5.6
50 to 99 acres	4,387	75.7	332,077	3.9	11,285,002	7.8
100 to 174 acres	11,249	157.0	1,765,952	20.8	31,793,870	22.1
175 to 259 acres	2,400	217.4	521,648	6.1	12,071,548	8.4
260 to 499 acres	4,938	375.3	1,853,346	21.8	31,512,083	21.9
500 to 999 acres	2,015	697.3	1,405,025	16.5	22,201,175	15.4
1,000 acres and over	948	2,582.5	2,448,211	28.8	22,262,060	15.4

[1] Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF— Farm property June 1, 1900.					Per cent of gross income on total investment in farm property.
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	
The State	$2,991	$491	$189	$667	$892	20.6
Under 3 acres	343	315	36	1,350	642	31.4
3 to 9 acres	768	395	44	208	319	22.5
10 to 19 acres	1,022	388	60	196	347	20.9
20 to 49 acres	1,165	368	76	279	410	21.8
50 to 99 acres	1,652	414	109	397	558	21.7
100 to 174 acres	1,855	389	128	454	681	20.6
175 to 259 acres	3,459	625	226	720	1,079	21.4
260 to 499 acres	4,577	600	307	898	1,296	20.3
500 to 999 acres	8,280	846	476	1,416	2,109	19.1
1,000 acres and over	16,970	1,295	896	4,322	4,779	20.3

The group of farms containing from 100 to 174 acres each includes a larger number of farms than any other class, showing the frequency of quarter-section holdings. The group "1,000 acres and over" constitutes a larger part of the total acreage than any other.

With a few exceptions the average values of all forms of farm property increase with the size of the farms. For the group of farms of less than 3 acres each all values are comparatively high, as this class contains a number of the florists' establishments of the state, and many market gardens, poultry farms, and city dairies. The high value of live stock for this group is due to the fact that it includes many ranges consisting of large areas of public domain, though the area actually owned or leased is less than 3 acres. The incomes from these industries are determined not so much by the area of owned or rented land used as by the amount of capital invested and the amounts expended for labor and fertilizers. The average gross incomes per acre for the various groups, classified by area, are as follows:

Farms under 3 acres, $308.39; 3 to 9 acres, $49.18; 10 to 19 acres, $26.81; 20 to 49 acres, $12.05; 50 to 99 acres, $7.37; 100 to 174 acres, $3.70; 175 to 259 acres, $4.96; 260 to 499 acres, $3.45; 500 to 999 acres, $3.02; 1,000 acres and over, $1.85. With the exception of the group of farms of 100 to 174 acres, which has a low average on account of the number of homesteads it contains, the average gross income per acre decreases regularly as the farms increase in size.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading features of the statistics relating to farms classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop, and constitutes at least 40 per cent of the total value of products not fed to live stock, the farm is classified as a "hay and grain" farm; similarly, if vegetables are the leading crop, constituting 40.0 per cent of the total value of products not fed to live stock, it is a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive their principal income from any one class of farm products. Farms with no income in 1899 are classified according to the agricultural operations upon other farms in the same locality.

TABLE 10.—NUMBER AND ACREAGE OF FARMS AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	33,202	256.0	8,499,297	100.0	$144,040,547	100.0

Miscellaneous	7,874	144.2	1,135,378	13.4	20,487,709	14.2

[1] Less than one-tenth of 1 per cent.

Table 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900. Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	Per cent of gross income on total investment in farm property.
The State	$2,991	$491	$189	$667	$892	20.6
Hay and grain	6,080	575	335	721	1,398	20.8
Vegetables	1,815	397	96	259	546	21.3
Fruits	2,728	606	124	273	806	21.6
Live stock	2,108	443	140	1,082	797	21.1
Dairy produce	2,331	499	132	669	665	18.3
Sugar	29,450	3,500	1,387	2,399	8,195	22.3
Flowers and plants	2,571	3,127	218	179	3,090	50.7
Nursery products	4,924	1,033	113	136	1,756	28.3
Miscellaneous	1,742	418	104	338	524	20.1

For the several classes of farms the average values per acre of products not fed to live stock are as follows: For farms deriving their principal income from flowers and plants, $104.85; nursery products, $41.61; sugar, $9.13; fruits, $8.08; vegetables, $5.82; dairy produce, $4.34; hay and grain, $3.70; miscellaneous, $3.63; and live stock, $2.45.

The wide variations shown in the averages and percentages of gross income are due largely to the fact that in computing gross income no deduction is made for expenditures. For florists' establishments, nurseries, and market gardens the average expenditure for such items as labor and fertilizers represents a far larger percentage of the gross income than in the case of "hay and grain," "live-stock," or "miscellaneous" farms. Were it possible to present the average net incomes, the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by the reported value of products not fed to live stock.

Table 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS. Average.	Total.	Per cent.	VALUE OF FARM PROPERTY. Total.	Per cent.

$250 to $499	1,457	344	99	361	351	16.6
$500 to $999	2,393	478	169	588	691	19.0
$1,000 to $2,499	4,716	741	307	983	1,517	22.6
$2,500 and over	12,691	1,430	722	2,775	4,705	26.7

There were 1,173 farmers reporting no income for 1899. Most of these farms are homesteads taken up too recently to have yielded any products in 1899. Some are suburban or summer homes, and many of them had changed owners or tenants, and the persons in charge, June 1, 1900, were unable to give definite information concerning the products of the preceding year. To this extent the reports fall short of giving a complete exhibit of farm income in 1899.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the Twelfth Census. The age grouping for neat cattle was determined by their present and prospective relation to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep by age and sex. The new classification permits of a very close comparison with previous census reports.

Table 14 presents a summary of live-stock statistics.

Table 14.—NUMBER OF DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS AND RANGES, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS OR RANGES.

LIVE STOCK.	Age in years.	ON FARMS OR RANGES. Number.	Value.	Average value.	NOT ON FARMS OR RANGES. Number.
Calves	Under 1	105,130	$889,058	$8.46	4,276
Steers	1 and under 2	39,340	698,051	17.74	732
Steers	2 and under 3	24,128	648,161	26.86	398
Steers	3 and over	9,096	330,940	36.38	211
Bulls	1 and over	7,489	269,811	36.03	121
Heifers	1 and under 2	44,113	805,325	18.26	1,274
Cows kept for milk	2 and over	107,232	4,076,189	38.01	11,809
Cows and heifers not kept for milk.	2 and over	58,395	1,722,503	29.50	300
Colts	Under 1	22,359	253,658	11.34	381
Horses	1 and under 2	30,312	502,760	16.59	386
Horses	2 and over	191,314	7,794,016	40.74	21,692

Table 14.—NUMBER OF DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS AND RANGES, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS OR RANGES—Continued.

LIVE STOCK.	Age in years.	ON FARMS OR RANGES.			NOT ON FARMS OR RANGES.
		Number.	Value.	Average value.	Number.
Mule colts	Under 1	441	$10,669	$24.19	3
Mules	1 and under 2	322	12,992	40.35	10
Mules	2 and over	1,927	114,524	59.43	394
Asses and burros	All ages	160	16,481	103.01	23
Lambs	Under 1	371,851	728,640	1.96	348
Sheep (ewes)	1 and over	459,158	1,382,745	3.01	597
Sheep (rams and wethers).	1 and over	98,864	339,544	3.43	170
Swine	All ages	181,535	830,704	4.58	5,569
Goats	All ages	2,876	10,757	3.74	132
Fowls:[1]					
Chickens[2]		1,196,639	614,838		
Turkeys		29,155			
Geese		64,488			
Ducks		66,433			
Bees (swarms of)		30,870	106,841	3.46	
Value of all live stock.			22,169,207		

[1] The number reported is of fowls over 3 months old. The value is of all, old and young.
[2] Including Guinea fowls.

The value of all live stock on farms and ranges, June 1, 1900, was $22,159,207, of which 38.6 per cent represents the value of horses; 24.2 per cent, that of neat cattle other than dairy cows; 18.4 per cent, that of dairy cows; 11.1 per cent, that of sheep; 3.7 per cent, that of swine; and 4.0 per cent, that of all other live stock.

No reports were secured of the value of live stock not on farms or ranges, but it is probable that such animals have higher average values than those on farms. Allowing the same averages, however, the value of all domestic animals not on farms or ranges is $1,502,639. Exclusive of poultry and bees not on farms, the total value of live stock in the state is approximately $23,661,846.

CHANGES IN LIVE STOCK KEPT ON FARMS AND RANGES.

The following table shows the changes since 1860 in the number of the most important domestic animals:

Table 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS AND RANGES: 1860 TO 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	107,232	287,691	243,985	2,850	558,022	181,535
1890	70,721	184,413	153,770	1,345	265,267	90,274
1880	27,622	106,932	45,848	626	292,883	46,828
1870	16,938	30,316	11,138	943	44,063	17,491
1860	9,660	18,799	4,772	159	10,157	6,383

[1] Lambs not included.

In comparison with those of 1860, the reports for 1900 show over eleven times as many dairy cows, over fifteen times as many other neat cattle, more than fifty times as many horses, nearly eighteen times as many mules, nearly fifty-five times as many sheep, and over twenty-eight times as many swine. The increase between 1890 and 1900 is indicated by the following percentages: Dairy cows, 51.6 per cent; other neat cattle, 56.0 per cent; horses, 58.7 per cent; mules and asses, 111.9 per cent; sheep, 110.4 per cent; and swine, 101.1 per cent.

The enumerators in 1900 were instructed to report no fowls under three months old, and in 1890 no such limitation was made, yet each class of fowls shows an increase in number. More than eleven times as many geese, and nearly five times as many ducks were reported in 1900 as in 1890. Turkeys increased in number 69.6 per cent, and chickens, 53.4 per cent in the same period of time.

ANIMAL PRODUCTS.

Table 16 is a summary of the products of the animal industry.

Table 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS AND RANGES IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	5,268,088	$618,975
Mohair and goat hair	Pounds	4,000	1,097
Milk	Gallons	[1]50,182,415	[2]3,816,691
Butter	Pounds	7,372,106	
Cheese	Pounds	151,669	
Eggs	Dozens	7,473,790	1,259,225
Poultry			848,291
Honey	Pounds	530,790	65,211
Wax	Pounds	9,540	
Animals sold			3,517,053
Animals slaughtered			1,168,802
Total			11,295,345

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of milk sold or consumed, and of butter and cheese made.

The value of animal products in 1899 was $11,295,345, or 32.4 per cent of the value of all farm products, and 38.1 per cent of the gross farm income. Of the total value, 41.5 per cent represents the value of animals sold and animals slaughtered; 33.8 per cent, that of dairy products; 18.6 per cent, that of poultry and eggs; 5.5 per cent, that of wool, mohair, and goat hair; and 0.6 per cent, that of honey and wax.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

The value of animals sold and animals slaughtered on farms was $4,685,855, or 15.8 per cent of the gross farm income. Of the whole number of farmers reporting domestic animals, 15,362, or 48.9 per cent, reported sales of live animals, the average amount per farm being

$228.94; and 17,106, or 54.5 per cent, report animals slaughtered, the average value per farm being $68.33. In securing reports of the sales of live animals the enumerators were directed to obtain from each farmer a statement of the amount received from sales in 1899, less the amount paid for animals purchased the same year.

DAIRY PRODUCE.

The production of milk in 1899 was 30,309,134 gallons greater than in 1889, a gain of 152.5 per cent. Butter made on farms increased 111.7 per cent in the last decade, and cheese made on farms, 112.8 per cent.

Of the $3,816,691 given in Table 16 as the value of all dairy produce, $2,452,525, or 64.3 per cent, represents the receipts from sales, and $1,364,166, or 35.7 per cent, the value of such produce consumed on farms. Of the former amount, $1,476,720 was received from the sale of 14,897,273 gallons of milk; $882,344 from 4,172,820 pounds of butter; $78,441 from 145,555 gallons of cream; and $15,020 from 126,670 pounds of cheese.

POULTRY AND EGGS.

The total value of the products of the poultry industry in 1899 was $2,107,516, of which amount 59.7 per cent represents the value of eggs produced and 40.3 per cent the value of fowls raised. Nearly five million dozen more eggs were produced in 1899 than in 1889, the rate of gain being 175.7 per cent.

WOOL.

Each decade since 1850 shows a marked increase in the amount of wool grown. More than three times as much wool was reported in 1900 as in 1890. But a part of this gain is only apparent, as the fleeces from a large number of sheep were omitted from the tables in 1890, but included in a general estimate of wool shorn after the enumeration. The average weight of fleeces increased from 6.3 pounds in 1890 to 9.1 pounds in 1900, which indicates improvement in the grade of sheep. The counties in the southeastern part of the state show the greatest increase in numbers of sheep, and in quantities of wool produced.

HONEY AND WAX.

The quantity of honey produced in 1899 was 530,790 pounds, three times as much as ten years before. There were 9,540 pounds of wax reported in 1899, three times as much as in 1889.

HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses and dairy cows, the total number of these animals, and the average number per farm. In computing the averages presented, only those farms which report the kind of stock under consideration are included.

TABLE 17.—HORSES AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.			DAIRY COWS.		
	Farms reporting.	Number.	Average per farm.	Farms reporting.	Number.	Average per farm.
Total	28,256	243,985	8.6	26,042	107,232	4.1
White farmers	27,208	219,280	8.1	25,663	106,101	4.1
Colored farmers	1,048	24,705	23.6	379	1,131	3.0
Owners[1]	23,784	206,520	8.7	22,073	86,977	3.9
Managers	331	7,149	21.6	298	2,116	7.1
Cash tenants	1,937	10,499	5.4	1,783	11,166	6.3
Share tenants	2,204	19,817	9.0	1,888	6,973	3.7
Under 20 acres	1,909	24,829	13.0	2,047	5,391	2.6
20 to 99 acres	6,915	27,694	4.0	6,818	22,724	3.3

Dairy	3,873	19,638	5.1	4,573	35,075	7.7
Miscellaneous[2]	6,172	22,778	3.7	5,954	18,166	3.1

[1] Including "part owners" and "owners and tenants."
[2] Including florists' establishments, nurseries, and sugar farms.

CROPS.

The following table gives the statistics of the principal crops grown in 1899:

TABLE 18.—ACREAGES, QUANTITIES, AND VALUES OF THE PRINCIPAL FARM CROPS IN 1899.

CROPS.	Acres.	Unit of measure.	Quantity.	Value.
Corn	10,483	Bushels	218,706	$104,263
Wheat	1,088,102	Bushels	21,187,527	9,028,209
Oats	126,841	Bushels	5,336,486	1,765,547
Barley	122,298	Bushels	3,641,056	1,268,480
Rye	3,077	Bushels	44,945	23,566
Buckwheat	96	Bushels	1,865	1,332
Flaxseed	149	Bushels	850	767
Clover seed		Bushels	12	54
Grass seed		Bushels	825	1,492
Hay and forage	497,139	Tons	827,413	5,831,088
Tobacco	5	Pounds	1,180	187
Hops	5,296	Pounds	6,813,830	589,582
Broom corn	67	Pounds	20,000	1,000
Peanuts	(1)	Bushels	15	15
Dry beans	296	Bushels	3,830	7,084
Dry pease	3,573	Bushels	91,899	78,124
Potatoes	25,119	Bushels	3,557,876	1,312,948
Sweet potatoes	52	Bushels	4,672	2,250
Onions	472	Bushels	107,111	73,623
Miscellaneous vegetables	13,376			967,045
Maple sirup		Gallons	126	113
Sorghum cane	28	Tons	82	146
Sorghum sirup		Gallons	438	198
Sugar beets	1,863	Tons	6,149	26,176
Small fruits	2,915			326,646
Orchard fruits	[2] 89,261	Bushels	1,180,357	[3] 999,487
Grapes	[2] 311	Centals	11,947	[4] 27,242
Nuts				810
Forest products				1,002,126
Flowers and plants	34			50,450
Seeds	86			11,667
Nursery products	155			28,699
Miscellaneous	15			[5] 1,784
Total	1,991,109			23,532,150

[1] Less than 1 acre.
[2] Estimated from number of vines or trees.
[3] Including value of cider, vinegar, etc.
[4] Including value of wine, raisins, etc.
[5] The greater part of this value was derived from products for which no acreage was reported.

Of the total value of crops, cereals contributed 51.8 per cent; hay and forage, 24.8 per cent; vegetables, including potatoes, sweet potatoes, and onions, 10.0 per cent; fruits, 5.7 per cent; forest products, 4.3 per cent; hops, 2.5 per cent; and all other crops, 0.9 per cent.

The average values per acre of the various crops are as follows: Flowers and plants, $1,483.82; nursery products, $185.15; seeds, $135.66; small fruits, $112.06; hops, $111.33; grapes, $87.59; miscellaneous vegetables, $72.30; potatoes, $52.27; beans and pease, $22.01; sugar beets, $14.05; hay and forage, $11.73; orchard fruits, $11.20; and cereals, $9.02.

CEREALS.

The following table is an exhibit of the changes in cereal production since 1859:

TABLE 19.—ACREAGE AND PRODUCTION OF CEREALS: 1859 TO 1899.

PART 1.—ACREAGE.

YEAR.[1]	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	122,298	96	10,483	126,841	3,077	1,088,102
1889	51,551	27	9,583	65,089	1,763	372,658
1879	14,680	106	2,117	37,962	518	61,554

[1] No statistics of acreage were secured prior to 1879.

PART 2.—BUSHELS PRODUCED.

YEAR.	Barley.	Buckwheat.	Corn.	Oats.	Rye.	Wheat.
1899	3,641,056	1,865	218,706	5,336,486	44,946	21,187,527
1889	1,269,140	430	156,413	2,273,182	19,188	6,345,426
1879	566,537	2,498	39,183	1,571,706	7,124	1,921,322
1869	55,787	316	21,781	255,169	4,453	217,043
1859	4,621	707	4,712	134,334	144	86,219

The total area devoted to cereals in 1879 was 136,937 acres; in 1889, 500,671 acres; and in 1899, 1,350,897 acres, nearly ten times the acreage reported twenty years before.

The increases in area under cereals in the decade 1889 to 1899, were: Buckwheat, 255.6 per cent; wheat, 192.0 per cent; barley, 137.2 per cent; oats, 94.9 per cent; rye, 74.5 per cent; and corn, 9.4 per cent. The total number of bushels produced in 1859 was 230,737, and in 1899, 30,430,585.

Of the total area devoted to cereals in 1899, 80.5 per cent was devoted to wheat; 9.4 per cent, to oats; 9.1 per cent, to barley; and 1.0 per cent, to corn, rye, and buckwheat.

The five counties, Whitman, Lincoln, Wallawalla, Spokane, and Adams in the eastern part of the state ranking in the order named, reported 76.3 per cent of the total area under wheat, while Whitman, Skagit, and Spokane contributed one-half of the total acreage in oats. The adjoining counties, Whitman, Columbia, Garfield, and Wallawalla reported 73.1 per cent of the total area devoted to barley, and, substituting Chelan county for Garfield county, the same group furnished 62.7 per cent of the acreage under corn.

HAY AND FORAGE.

In 1900, 26,738 farmers, or 80.5 per cent of the total number, reported hay or forage crops. Exclusive of cornstalks, they obtained an average yield of 1.7 tons per acre. The total acreage in hay and forage for 1899 was 73.8 per cent greater than ten years before.

In 1899 the acreages and yields of the various kinds of hay and forage were as follows: Wild, salt, and prairie grasses, 49,963 acres and 51,260 tons; millet and Hungarian grasses, 319 acres and 496 tons; alfalfa or lucern, 35,166 acres and 118,559 tons; clover, 18,484 acres and 40,054 tons; other tame and cultivated grasses, 158,872 acres and 301,656 tons; grains cut green for hay, 226,652 acres and 301,676 tons; crops grown for forage, 7,683 acres and 13,196 tons; and cornstalks, 522 acres and 516 tons.

In Table 18 the production of cornstalks is included under "hay and forage," but the acreage is part of that given for "corn," as the forage secured was an incidental product of the corn crop.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 are shown in the following table:

TABLE 20.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900	1890	1899	1889
Apples	2,735,824	315,479	728,978	295,196
Apricots	31,129	5,142	5,254	3,856
Cherries	210,516	22,852	62,114	11,692
Peaches	226,636	72,701	80,990	63,497
Pears	310,597	32,513	78,236	26,868
Plums and prunes	1,290,845	85,657	229,207	66,909

In 1900 over one-third of the farmers of the state reported orchard products worth $999,487. Of this amount, Whitman county contributed $132,569; Yakima, $108,696; Spokane, $78,592; King, $54,278; Wallawalla, $52,767; and Chelan, $50,640.

Large increases are to be noted in the numbers of all kinds of trees during the last decade, the gain in the total number of trees being over 4,000,000. In this period the number of apple trees has increased 2,420,345. In 1890, 59.0 per cent of all fruit trees in the state were apple trees, while in 1900 apple trees comprised but 56.9 per cent. The largest numbers of these trees are found in the southeastern counties of the state, Spokane leading.

Not only has the number of plum and prune trees increased more than fifteenfold during the decade, but the relative importance of these fruits has risen from 16.0 per cent of the total number of orchard trees in 1890 to 26.9 per cent of the number reported in 1900.

There were over nine times as many pear trees in 1900 as ten years before. More than one-third the total number of these trees was grown in Whitman, Wallawalla, and Spokane counties.

The total number of peach trees has more than tripled during the decade. This increase was very generally distributed, decreases being reported in but four counties. The largest numbers of trees were reported by Yakima and Whitman counties. Comparatively little attention was given to apricots. All counties show increases in cherries during the decade.

In addition to the trees given in Table 20, unclassified fruit trees to the number of 65,312 were reported, with a yield of 5,578 bushels of fruit. The value of orchard products given above includes the value of 1,102 barrels of cider, 416 barrels of vinegar, and 253,720 pounds of dried and evaporated fruits manufactured on farms.

VEGETABLES.

The value of all vegetables produced in the state in 1899, including potatoes, sweet potatoes, and onions, was $2,355,866, of which the value of potatoes constituted 55.7 per cent. This important crop was reported by 21,539 farmers, or 64.9 per cent of the total number in the state. The largest acreages devoted to potatoes were in the southeastern counties of Spokane and Whitman.

Aside from the land devoted to potatoes, sweet potatoes, and onions, 13,376 acres were used in the growing of miscellaneous vegetables. Of this area, the products of 8,409 acres were not reported in detail. Of the remaining 4,967 acres, concerning which detailed reports were received, 1,146 acres were devoted to cabbages, 1,016 to carrots, 584 to turnips, 569 to sweet corn, 494 to watermelons, 338 to beets, 303 to tomatoes, 198 to muskmelons, and 319 to other vegetables.

SMALL FRUITS.

The total area used in the cultivation of small fruits in 1899 was 2,915 acres distributed among 9,638 farms. The value of the fruit grown was $326,646, an average of $33.89 per farm. Of the total area, 1,268 acres, or 43.5 per cent, were devoted to strawberries, the total production of which was 2,577,580 quarts, grown principally in King, Pierce, Wallawalla, Spokane, and Clarke counties. The acreages and productions of the other berries were as follows: Raspberries and Logan berries, 625 acres and 1,134,970 quarts; blackberries and dewberries, 388 acres and 808,340 quarts; currants, 238 acres and 416,170 quarts; gooseberries, 211 acres and 356,570 quarts; and other berries, 185 acres and 124,150 quarts.

SUGAR BEETS.

Washington had in 1900 but three counties reporting sugar beets, but the industry bids fair to become one of importance in the state. In 1899, 29 farms devoted to this crop an area of 1,863 acres, an average of 64.2 acres per farm. There were obtained and sold from this land 6,149 tons of beets, an average of 3.3 tons per acre, for which was received $26,176, an average of $903 per farm, $14 per acre, and $4.26 per ton. This crop was grown in the southeastern part of the state, Spokane county alone reporting 92.8 per cent of the total acreage.

HOPS.

The earliest report of hops for Washington was in 1860, when the amount produced was 44 pounds. The industry has become one of great importance, as is shown by the rapid increase in the number of acres devoted to their production. For 1879, 534 acres were reported; for 1889, 5,113 acres; and for 1899, 415 farmers reported 5,296 acres, an average of 12.8 acres per farm. They obtained and sold from this land 6,813,830 pounds of hops, an average of 1,287 pounds per acre, for which they received $589,582, an average of $1,421 per farm, $111 per acre, and $0.09 per pound.

The two counties producing the most hops in 1899 were Yakima and Pierce, which reported 66.0 per cent of the total acreage.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 34 acres, and the value of the products sold therefrom was $50,450. These flowers and plants were grown by 35 farmers and florists, of whom 17 made commercial floriculture their principal business. These 17 had invested in land, buildings, implements, and live stock $103,610, of which $53,160 represents the value of the buildings. Their sales of flowers and plants amounted to $46,970, and they secured other products valued at $5,560. They expended $10,210 for labor, and $985 for fertilizers. The average gross income was $3,090.

In addition to the 17 principal florists' establishments, 139 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 227,550 square feet, making, with the 125,820 square feet belonging to the florists' establishments, a total of 353,370 square feet of land under glass.

NURSERIES.

The total value of nursery products sold in 1899 was $28,699. This was reported by the operators of 36 farms and nurseries, of whom 15 derived their principal income from the nursery business. They had invested in the aggregate $93,084, of which $73,855 represents the value of land and improvements other than buildings; $15,495, that of buildings; $1,690, that of implements; and $2,044, that of live stock. Their sales of nursery products amounted to $24,256, and they obtained other products worth $2,082. Their expenditure for labor was $4,910, and for fertilizers, $20. The average gross income was $1,756.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $5,280,190, an average of $159 per farm. The average expenditure was $1,788 for sugar farms, $601 for florists' establishments, $327 for nurseries, $310 for hay and grain farms, $109 for fruit farms, $96 for live-stock farms, $86 for vegetable farms, and $83 for dairy farms. "Managers" expended on an average, $683; "share tenants," $260; "cash tenants," $146; and "owners," $107. White farmers expended $163 per farm, and colored farmers, $54.

Fertilizers purchased in 1899 cost only $29,165, an average of less than $1 per farm, but almost three times the amount expended in 1889. The average expenditure was $58 for florists' establishments, $3 for vegetable farms, and $1 for hay and grain farms.

INDIAN RESERVATIONS.

The Indian population of Washington, although not as large as that of several other states, is composed of numerous small tribes, principal among which are the Salishan, Shahaptian, and Chinookan. The tribes along the coast are fishermen and fur traders, their catches including the whale and seal. Those among the mountains live largely on game, fish, and berries. Nine reservations, as follows, reported agriculture: Colville, Lummi, Makah, Muckleshoot, Queniult, Spokan, Swinomish, Tulalip and Yakima.

COLVILLE AND SPOKAN.

Colville reserve, embracing an area of 4,374 square miles, is situated in Ferry and Okanogan counties. The land is adapted to agriculture and stock raising, and most of the tribes here have made commendable progress in these occupations. The population of the reserve is 1,477.

The Spokan reservation, whose agricultural statistics were enumerated with those of Colville, lies in Stevens county and contains an area of 240 square miles. The Indians are thrifty and industrious, but need the assistance of improved agricultural implements and machinery.

The principal crops of the 351 Indian farmers of the two reserves are wheat and oats, supplemented by a few acres of corn. Their hay consists largely of grains cut green. Many raise gardens of potatoes and other vegetables. Some of them own a considerable number of range cattle in addition to their Indian pony stock, and a few possess chickens and swine.

LUMMI.

Lummi reservation, with an area of 3 square miles, is situated in Whatcom county. The Indians are bands of Dwamish, Etakmur, Lummi, Snohomish, and Swinomish tribes, with a total population of 359. They do some fishing and logging in addition to tilling the soil, and are largely self-supporting.

The 28 Indian farmers raised small patches of oats, wheat, tame hay, potatoes, and other vegetables. Nearly all own orchards of apple, pear, plum, and cherry trees, and a few also raise small fruits. Their live stock consists principally of good American farm horses, small flocks of sheep, and a few cattle. A number own dairy cows and report milk and butter; others report small sales of live stock and animal products. Chickens and swine are found on most of the farms.

MAKAH.

Makah reservation, in Clallam county, has an area of 36 square miles. The Makah and Quileute Indians on this reserve, with a population of 371, are self-supporting, but very poor. Fish is their principal diet and source of income. Seven Indians reported small herds of horses and cattle, but as grass is very limited they can not carry on stock raising extensively. Small sales of live stock were reported by four of them.

MUCKLESHOOT.

Muckleshoot reservation contains an area of 5 square miles and is situated in King county. The Muckleshoot is a self-supporting agricultural tribe, numbering 146. All wear citizens' clothing, and the majority know enough English to carry on ordinary conversation. The principal crops of the 30 Indian farmers are oats, wheat, and tame hay. Potatoes are also quite generally raised, and a few have small fruit. A number possess orchards of apple, plum, and cherry trees. The tracts cultivated by these farmers are mere patches of from 5 to 30 acres. Their live stock consists of a few horses, Indian ponies, cattle, and sheep. Chickens and swine are found on a few farms.

QUENIULT.

Queniult reserve, embracing an area of 350 square miles, is located in Chehalis county. The larger portion of the land is broken, mountainous, and thickly covered with underbrush, the only cultivable tracts lying along the river bottoms. The 23 Indian farmers raised small patches of potatoes and tame hay, and one had 3 acres in oats. Most of them own work horses or ponies, and some have a few beef cattle and dairy cows. Chickens are common among these Indians, while but one reported swine.

SWINOMISH.

Swinomish reserve has an area of 11 square miles and is situated in Skagit county, on Fidago Island. The Indians here are practically self-supporting, obtaining their living by fishing and tilling the soil. The present population is 275. Oats and tame hay are the crops of the 7 Swinomish farmers. Their live stock consists of a few horses, sheep, and dairy cows, and 2 farmers owned chickens.

TULALIP.

Tulalip reservation, having an area of 14 square miles, is located in Snohomish county, on Puget Sound. The greater portion of this reserve is heavily timbered and requires considerable energy and money to clear it. The Indians are not agriculturists, as a rule, only 29 Indian farmers being reported. These raised a few acres of tame hay, potatoes, and garden vegetables; some also cultivated small fruit. Nearly all had orchards of apple, pear, plum, and cherry trees. Horses, a few sheep, and beef cattle largely comprised their live stock. A number also owned dairy cows and chickens.

YAKIMA.

Yakima reservation, with an area of 1,250 square miles, is situated in the south central part of the state. Approximately two-thirds of this tract is a dry, sagebrush desert with no facilities for irrigation. Bands of Klikitat, Paloos, Topnish, Wasco, and Yakima Indians are located on this reserve, and number in all 2,219. Agriculture is the principal occupation where it can be carried on, and the Indians who are so situated that irrigation is available are making remarkable progress. They are accumulating stock, extending their agricultural operations, and building comfortable homes. Under the direction of a surveyor, they have constructed a large number of ditches and utilize all the water available. Indians who have no water on their allotments hunt, dig roots, and gather berries for subsistence. The principal crops are oats, wheat, and barley, in the order named. The hay crops consisted of wild grasses, alfalfa, and other tame grasses and grains cut green. Of the 269 farms on the reservation, 196 were operated by Indians, the others being largely those of white renters. The majority of Indian farmers had from 10 to 80 acres under cultivation. A number raised patches of potatoes and garden vegetables and some also had small fruit. Many own orchards of apple, peach, pear, plum, and cherry trees. A number have accumulated substantial herds of range cattle, while a few have large flocks of sheep. Chickens and swine are common, and a few Indians have dairy cows.

IRRIGATION STATISTICS.

The Cascade Mountains, extending across the western third of the state of Washington, divide it into two parts unlike in climate and agricultural conditions. West of the mountains the annual precipitation is heavy. Eastward the climate is arid and semiarid. The arid region is bounded on the west by the foothills of the Cascade Mountains, and on the east gradually merges into the semiarid foothills near the Idaho line. The soil of central and eastern Washington is very fertile, and when water is artificially applied to growing crops the results are marvelous.

These regions, lying entirely within the drainage basin of the Columbia River, have an area of 42,328 square miles, or 63.0 per cent of the state. The Columbia River enters the state from the northeastern corner, flows south for a distance of about 159 miles, then veering abruptly westward forms a great curve as it pursues its course in a southerly direction to about the center of the state, then turning west, forms the boundary between Oregon and Washington. With its numerous branches it furnishes an abundant water supply.

With the exception of a few current water wheels, no irrigation works have yet been undertaken on the Columbia River. On its tributary streams, however, great progress has been made toward reclaiming areas of the arid lands. The most important of these branches is the Yakima River, which has its sources in numerous lakes near the crest of the Cascade Mountains. From these lakes it takes its way southeast for a distance of about 40 miles through a rugged country, where the rocky soil and frequent frosts make agriculture a hazardous undertaking.

Turning directly south, the river flows into the Kittitas Valley. Here irrigation has made rapid advances, and a network of ditches, large and small, diverts water from the river and its branches upon thousands of acres in crops. The Ellensburg Water and Power Company and the West Side Canal Company are the most important irrigation enterprises in this vicinity. At the lower end of the valley the banks converge, forming a canyon with high, precipitous walls, through which the river rushes for a distance of 18 miles, emerging into the Yakima Valley, where it receives the waters of the Naches River and Selah and Atanum creeks, all of which are mountain streams. As these streams approach the main river, the great spurs forming their canyons gradually recede from the banks, leaving a broad, fertile valley, where several important canals have transformed what was originally a desert into a region of ideal farms.

Just below Yakima Valley the river is tapped on its left bank by the Sunnyside Canal, the largest in Washington. This canal was built at a cost of $600,000, is 42 miles long, and irrigates 10,000 acres in fruits and field crops.

Gradually curving to the east, the river pursues its course for a distance of almost 75 miles. At intervals irrigation improvements of varying importance are evidenced by productive farms and comfortable homes.

From the source of Yakima River to its mouth, the annual precipitation gradually decreases. The moisture in the foothills is sufficient to raise crops not too sensitive to cold, but farther down the river the soil can not be successfully cultivated without irrigation. In several places are elevated tablelands, notably Swauk and Thorp prairies, which receive sufficient natural moisture to produce fair crops of grain.

The Blue Mountains and foothills in southeastern Washington form a watershed for Wallawalla River and Asotin Creek, two important streams.

The Wallawalla River rises in Oregon and flows in a northeasterly direction into Washington, where it receives water from a score of tributaries. These streams, near their mouths, form deltas of rich alluvium peculiarly adapted to the cultivation of orchard fruits. A rapid fall in the creeks admits of the construction of ditches at a very moderate expense, but the valleys are narrow and only small areas can be irrigated. Several canals are in use, and others are in course of construction. On the higher ground the precipitation is sufficient for cereals, and good crops are raised. After leaving this valley the Wallawalla gradually sinks lower in its canyon and maintains a westward course for a distance of about 40 miles to its junction with the Columbia River.

Many small streams rising in the eastern foothills of the Blue Mountains unite to form Asotin Creek, which furnishes its valley with a plentiful supply of water. From the left bank, about 6 miles from its mouth, the Vineland ditch, 14 miles long, has been constructed by the Lewiston Water and Power Company at a cost of $80,000. This company has divided its land holdings into small farms worth from $150 to $300 per acre. Purchasers give their entire attention to gardens and orchards, and remarkable results are obtained. The ditch at present irrigates 1,400 acres, but is designed to supply 5,000 acres. The sketch map represents, by areas in solid black, the regions in which irrigation is successfully practiced to any considerable extent.

The following table shows the relative increase of irrigation in the whole state since 1899, including counties west of the Cascade Mountains, where irrigation is very beneficial to truck farmers:

TABLE A.—NUMBER OF IRRIGATORS AND ACRES IRRIGATED IN 1889 AND 1899, WITH PERCENTAGES OF INCREASE, BY COUNTIES.

COUNTIES.	NUMBER OF IRRIGATORS.			NUMBER OF ACRES IRRIGATED.		
	1899	1889	Per cent of increase.	1899	1889	Per cent of increase.

Indian reservations:						
Spokane	43	....	....	140	....	....
Yakima	184	....	....	9,023	....	....

[1] Chelan organized from parts of Kittitas and Okanogan in 1899.
[2] Ferry organized from part of Stevens in 1899.
[3] Decrease.

In the ten years ending with 1899, the number of irrigators in the state increased from 1,046 to 3,513, or 235.9 per cent, and the area irrigated from 48,799 acres to 135,470 acres, or an increase of 177.6 per cent.

As the artificial application of water requires more than an ordinary amount of labor and capital, there is a marked tendency toward a more intense cultivation of small areas. In 1889 the average size of the irrigated area of farms of Washington was 47 acres, while in 1899 it was but 39 acres.

Table B is an exhibit, by counties, of the number of irrigated farms compared with the total number of farms, and of the irrigated acreage compared with the total improved acreage.

TABLE B.—COMPARISON OF IRRIGATED FARMS TO TOTAL NUMBER OF FARMS, AND OF IRRIGATED ACREAGE TO IMPROVED ACREAGE, JUNE 1, 1900.

COUNTIES.	NUMBER OF FARMS.			IMPROVED ACREAGE.		
	Total.	Irrigated.	Per cent irrigated.	Total.	Irrigated.	Per cent irrigated.

King	1,785	17	1.0	42,196	151	0.4
Kittitas	699	549	78.5	55,057	47,373	86.0
Klickitat	1,080	151	14.0	115,530	1,235	0.1
Lincoln	1,911	54	2.8	516,924	1,069	0.2
Okanogan	506	251	49.6	19,599	6,377	32.5
Spokane	2,911	31	1.1	280,159	718	0.3
Stevens	1,132	104	9.2	57,582	1,926	3.3
Wallawalla	1,029	231	22.4	391,719	6,100	1.6
Whitman	3,081	44	1.4	711,975	863	0.1
Yakima	1,293	1,123	86.9	104,680	47,588	45.6
All other counties	12,844	51	0.4	347,646	233	0.1
Indian reservations:						
Spokan	351	43	12.3	10,699	140	1.3
Yakima	269	184	68.4	17,993	9,023	50.1

Of the 33,202 farms of the state, 3,513, or 10.6 per cent, were irrigated in 1899. Of the total improved acreage, 3.9 per cent was irrigated.

Alfalfa, vegetables, and fruits are generally relied upon to give the highest returns where water is available. Cereals are seldom irrigated, being raised on the high plateaus, which receive sufficient moisture to produce fair yields.

Table C gives the acreage and production of all crops in eastern Washington, and of the crops grown on irrigated land.

TABLE C.—ACREAGE AND PRODUCTION OF ALL CROPS, AND OF IRRIGATED CROPS: 1899.[1]

CROPS.	ACREAGE.			Unit of measure.	PRODUCTION.		
	Total.	Irrigated.	Per cent irrigated.		Total.	Irrigated.	Per cent irrigated.

Yakima	7.81	1.55	16.17	40.25	8.58

[1] East of Cascade mountains, not including Indian reservations.

Irrigation in eastern Washington has greatly increased land values. In counties where irrigation is practiced, the farm values steadily increase in proportion to the extent to which irrigation is carried on. In Asotin county small farms under the Vineland ditch produce the finest quality of fruits, and have thus acquired a value much higher than land in other counties.

Table E is an exhibit of the area irrigated from streams in 1899, with the number, and cost of construction of the irrigation systems, and total length of main ditches.

TABLE E.—ACREAGE IRRIGATED FROM STREAMS IN 1899, WITH NUMBER AND COST OF CONSTRUCTION OF SYSTEMS, AND TOTAL LENGTH OF MAIN DITCHES.

COUNTIES.	Number of acres irrigated.	SYSTEMS OPERATED IN 1899.			
		Number.	Length of main ditches in miles.	Cost of construction.	
				Total.	Average per acre irrigated in 1899.
The State	133,698	801	806	$1,679,319	$12.56
Adams	423	11	4	1,293	3.06
Asotin	1,698	12	23	82,089	48.34

Whitman	758	21	15	8,855	11.68
Yakima	46,402	91	299	1,046,900	22.56
All other counties	397	75	4	1,500	3.78
Spokan and Yakima Indian reservations.	9,163	45	19	197,000	21.50

[1] Includes $40,000, cost of Liberty Lake ditch, designed to irrigate 2,600 acres; completed in 1899, but irrigated only 200 acres in that year.

Chelan county was formed in 1899 from parts of Kittitas and Okanogan counties. Yakima and Kittitas counties now comprise the entire territory drained by Yakima River. The area irrigated in Yakima Valley in 1889 was a little more than 38,300 acres. In 1899 there were irrigated from streams in this valley, exclusive of Yakima Indian reservation, 93,775 acres, an increase of 55,434 acres, or 144.6 per cent.

On account of the uncertainty of success and the great expense attached to prospecting for underground water, well irrigation in eastern Washington has not advanced very rapidly.

The principal artesian basins from which water is now taken are in Moxie Valley and in the vicinity of Wallawalla. In these localities flowing water has been obtained and is used for irrigation. Until recently no care has been exercised to prevent a waste of water, and, as a result, in several instances the pressure has become insufficient to force water to the surface. Now, however, wise statutes prohibit waste in any manner, the farmers have become more ambitious to develop and foster this mode of irrigation, and it promises to become an important factor in the raising of agricultural products. Water was obtained from wells, in 1899, for 77 farms with 1,772 acres of irrigated land. The total cost of construction of these systems was $43,050, or an average cost per acre irrigated of $24.29.

Table F shows the values, by counties, of crops produced on irrigated land.

TABLE F.—VALUE OF CROPS PRODUCED ON IRRIGATED LAND, BY COUNTIES.

COUNTIES.	All crops.	Hay and forage.	Cereals.	Vegetables.	Orchard fruits.	Small fruits.	Other crops.

In the Yakima Valley, the value of irrigated products in 1899 was $1,506,106, or 64.0 per cent of the value of the irrigated products of the state. The value of hay and forage was $703,390, or 47.0 per cent of the total value of products in the valley. A large proportion of this hay and forage was alfalfa. Vegetables and orchard fruits ranked next in importance. Only a small percentage of cereals was irrigated.

O

Twelfth Census of the United States.

CENSUS BULLETIN.

No. 232. WASHINGTON, D. C. July 8, 1902.

AGRICULTURE.

SOUTH CAROLINA.

Hon. WILLIAM R. MERRIAM,
Director of the Census.

SIR: I have the honor to transmit herewith, for publication in bulletin form, the statistics of agriculture for the state of South Carolina, taken in accordance with the provisions of section 7 of the act of March 3, 1899. This section requires that—

The schedules relating to agriculture shall comprehend the following topics: Name of occupant of each farm, color of occupant, tenure, acreage, value of farm and improvements, acreage of different products, quantity and value of products, and number and value of live stock. All questions as to quantity and value of crops shall relate to the year ending December thirty-first next preceding the enumeration.

A "farm," as defined by the Twelfth Census, includes all the land under one management used for raising crops and pasturing live stock, with the wood lots, swamps, meadows, etc., connected therewith. It includes also the house in which the farmer resides and all other buildings used by him in connection with his farming operations.

The farms of South Carolina, June 1, 1900, numbered 155,355, and were valued at $126,761,530. Of this amount, $26,955,670, or 21.3 per cent, represents the value of buildings; and $99,805,860, or 78.7 per cent, the value of land and improvements other than buildings. On the same date the value of farm implements and machinery was $6,629,770, and of live stock, $20,199,859. These values, added to that of farms, give $153,591,159, the "total value of farm property."

The products derived from domestic animals, poultry, and bees, including animals sold and animals slaughtered on farms, are referred to in this bulletin as "animal products." The total value of such products, together with the value of all crops, is termed "total value of farm products." This value for 1899 was $68,266,912, of which amount $9,376,499, or 13.7 per cent, represents the value of animal products; and $58,890,413, or 86.3 per cent, the value of crops, including forest products cut or produced on farms. The total value of farm products for 1899 exceeds that for 1889 by $16,928,927, or 33.0 per cent.

The "gross farm income" is obtained by deducting from the total value of farm products the value of the products fed to live stock on the farms of the producers. In 1899 the reported value of products fed was $5,736,550, leaving $62,530,362 as the gross farm income. The ratio which this amount bears to the "total value of farm property" is referred to in this bulletin as the "percentage of gross income upon investment." For South Carolina, in 1899, it was 40.7 per cent.

As no reports of expenditures for taxes, interest, insurance, feed for stock, and similar items have been obtained by any census, no statement of net farm income can be given.

The statistics presented in this bulletin will be treated in greater detail in the report on agriculture in the United States. The present publication is designed to present a summarized advance statement for South Carolina.

Very respectfully,

L. G. Powers.

Chief Statistician for Agriculture.

AGRICULTURE IN SOUTH CAROLINA.

GENERAL STATISTICS.

South Carolina has a total land area of 30,170 square miles, or 19,308,800 acres, of which 13,985,014 acres, or 72.4 per cent, are included in farms.

Along the coast and for 100 miles inland, South Carolina is generally low and level, and covered to a considerable extent by forests. West of this alluvial plain is a range of sand hills, while still farther west the "ridge country" rises abruptly, including all the remainder of the state, from the Savannah River to the Broad River. The average elevation of this part of the state is nearly two thousand feet above sea level.

The soils of the state are generally light and friable. In the lowlands along the coast the soil is sandy and the vegetation is subtropical. The sand hills are the least fertile parts of the state, while in the highlands, where the soil is clayey, there are immense fruit orchards.

NUMBER AND SIZE OF FARMS.

The following table gives, by decades since 1850, the number of farms, the total and average acreage, and the percentage of farm land improved:

Table 1.—FARMS AND FARM ACREAGE: 1850 TO 1900.

YEAR.	Number of farms.	NUMBER OF ACRES IN FARMS.				Per cent of farm land improved.
		Total.	Improved.	Unimproved.	Average.	
1900	155,355	13,985,014	5,775,741	8,209,273	90.0	41.3
1890	115,008	13,184,652	5,255,237	7,929,415	114.6	39.9
1880	93,864	13,457,613	4,132,050	9,325,563	143.4	30.7
1870	51,889	12,105,280	3,010,539	9,094,741	233.3	24.9
1860	33,171	16,195,919	4,572,060	11,623,859	488.3	28.2
1850	29,967	16,217,700	4,072,651	12,145,049	541.2	25.1

The number of farms reported in 1900 was over five times as great as in 1850, and 35.1 per cent greater than in 1890. The total farm area, as shown in the above table, decreased over four million acres in the two decades from 1850 to 1870, and during the following thirty years there was an increase of but 15.5 per cent. Except for the Civil War decade, the area and per cent of improved farm land increased throughout the half century. The rapid increase in the number of farms and the very slight increase in the total acreage involved a decrease in the average size of farms, which, together with the increase in per cent of farm land improved, indicates a progressive division of farm holdings and a more complete utilization of the soil.

FARM PROPERTY AND PRODUCTS.

Table 2 presents a summary of the principal statistics relating to farm property and products for each census year, beginning with 1850.

Table 2.—VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND OF FARM PRODUCTS: 1850 TO 1900.

YEAR.	Total value of farm property.	Land, improvements, and buildings.	Implements and machinery.	Live stock.	Farm products.[1]
1900	$153,591,159	$126,761,530	$6,629,770	$20,199,859	$68,266,912
1890	119,849,272	99,104,600	4,172,262	16,572,410	51,337,985
1880	84,079,702	68,677,482	3,202,710	12,199,510	41,108,112
1870[2]	59,535,219	44,808,763	2,282,946	12,443,510	[3]41,909,402
1860	169,738,630	139,652,508	6,151,657	23,934,465	....
1850	101,628,053	82,431,684	4,136,354	15,060,015	....

[1] For the year preceding that designated.
[2] Values for 1870 were reported in depreciated currency. To reduce to specie basis of other figures they must be diminished one-fifth.
[3] Includes betterments and additions to live stock.

This table shows the remarkable increase in farm values in the decade from 1850 to 1860, the disastrous effect of the Civil War in the following decade, and the subsequent recovery of the state which in 1900 had very nearly regained the valuations of 1860.

The gain in the total value of farm property since 1890 was $33,741,887, or 28.2 per cent. The increase in the value of land, improvements, and buildings was $27,656,930, or 27.9 per cent; in that of live stock it was $3,627,449, or 21.9 per cent; and in that of implements and machinery, $2,457,508, or 58.9 per cent. The value of products was 33.0 per cent greater in 1899 than in 1889. A portion of this increase, and of that shown for implements and machinery, is doubtless the result of a more detailed enumeration in 1900 than in previous census years.

COUNTY STATISTICS.

Table 3 is a statement of general agricultural statistics by counties.

Table 3.—NUMBER AND ACREAGE OF FARMS, AND VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, JUNE 1, 1900, WITH GROSS INCOME (PRODUCTS OF 1899 NOT FED TO LIVE STOCK) AND EXPENDITURES IN 1899 FOR LABOR AND FERTILIZERS, BY COUNTIES.

COUNTIES.	NUMBER OF FARMS.		ACRES IN FARMS.		VALUES OF FARM PROPERTY.				Gross income (products of 1899 not fed to live stock).	EXPENDITURES.	
	Total.	With buildings.	Total.	Improved.	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		Labor.	Fertilizers.
The State	155,355	148,864	13,985,014	5,775,741	$99,805,860	$26,955,670	$6,629,770	$20,199,859	$62,530,362	$6,107,100	$4,494,410

[1] Indian reservation.

On account of numerous territorial changes occurring in the last decade in South Carolina, it is impossible to make many accurate comparisons by counties for the census years, 1890 and 1900. For the last decade increases in the number of farms are shown for all counties whose boundaries were not changed. An increase in the acreage of farm land is reported in three-fourths of the counties, and the increase in the acreage of improved land is still more general. The average size of farms for the state is 90 acres, and varies from 48.2 acres in Beaufort county to 187.7 acres in Georgetown county.

Between 1890 and 1900 the value of farms increased in almost all counties, the average value for the state in 1900 being $816. Increases in the value of implements and machinery and of live stock are reported from nearly all counties.

The average expenditure per farm for labor varied greatly, being highest in the eastern and lowest in the northwestern counties. In Marlboro county the average was over $100 per farm. Berkeley, Greenville, Marion, Marlboro, and Richland counties reported decreased expenditures for fertilizers between 1889 and 1899. All other counties show increases.

FARM TENURE.

Table 4 gives a comparative statement of farm tenure for 1880, 1890, and 1900, showing the number and per cent of farms operated by owners and by tenants. Tenants are divided into two groups: "Cash tenants," who pay a rental in cash or a stated amount of labor or farm produce, and "share tenants," who pay as rental a stated share of the products.

In Table 5 the tenure of farms for 1900 is given by race of farmer, and farms operated by "owners" are subdivided into four groups, designated as farms operated by "owners," "part owners," "owners and tenants," and "managers." These groups comprise, respectively: (1) Farms operated by individuals who own all the land they cultivate; (2) farms operated by individuals who own a part of the land and rent the remainder from others; (3) farms operated under the joint direction and by the united labor of two or more individuals, one owning the farm or a part of it, and the other, or others, owning no part, but receiving for supervision or labor a share of the products; and (4) farms operated by individuals who receive for their supervision and other services a fixed salary from the owners.

TABLE 4.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES: 1880 TO 1900.

YEAR.	Total number of farms.	NUMBER OF FARMS OPERATED BY— Owners.[1]	Cash tenants.	Share tenants.	PER CENT OF FARMS OPERATED BY— Owners.[1]	Cash tenants.	Share tenants.
1900	155,355	60,471	57,046	37,838	39.0	36.7	24.3
1890	115,008	51,428	31,913	31,667	44.7	27.8	27.5
1880	93,864	46,645	21,974	25,245	49.7	23.4	26.9

[1] Including "part owners," "owners and tenants," and "managers."

TABLE 5.—NUMBER AND PER CENT OF FARMS OF SPECIFIED TENURES, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER.

PART 1.—NUMBER OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	155,355	52,623	6,310	484	1,054	57,046	37,838
White	69,954	37,120	2,934	393	874	14,612	14,021
Colored[1]	85,401	15,503	3,376	91	180	42,434	23,817

PART 2.—PER CENT OF FARMS OF SPECIFIED TENURES.

RACE.	Total number of farms.	Owners.	Part owners.	Owners and tenants.	Managers.	Cash tenants.	Share tenants.
The State	100.0	33.9	4.1	0.3	0.7	36.7	24.3
White	100.0	53.1	4.2	0.6	1.2	20.9	20.0
Colored[1]	100.0	18.2	3.9	0.1	0.2	49.7	27.9

[1] Comprising 20 Indians, and 85,381 negroes.

Since 1880 the number of farms has increased 65.5 per cent. The number of farms operated by owners gained 29.6 per cent; by cash tenants, 159.6 per cent; and by share tenants, 49.9 per cent. The greater part of the increase occurred in the last decade, which shows an increase of 35.1 per cent in number of farms, 17.6 per cent in farms operated by owners, 78.7 per cent in cash-tenant farms, and 19.5 per cent in share-tenant farms. The percentages in Table 4 show that the number of tenants has increased more rapidly than that of farms operated by owners.

In 1900, 45.0 per cent of the farms in the state were operated by white farmers and 55.0 per cent, by colored farmers. Of the white farmers, 57.8 per cent own all or a part of the farms they operate, and 42.2 per cent operate farms owned by others. For the colored farmers the corresponding percentages are 22.2 and 77.8.

In 1890, 49.8 per cent of all tenants were share tenants, and in 1900, 39.9 per cent. The relative number of farms rented for cash or for a share of the products is determined largely by the race of the farmers and the kinds of crops grown. In the western counties, where diversified farming is more general and a larger per cent of farmers are white, share tenants outnumber cash tenants, but in the leading cotton-growing counties, where more that one-half of the farmers are colored, cash tenants exceed share tenants. The greater number of colored farmers in the cotton counties are classed as cash tenants, but where local contract systems prevail the distinction between cash and share tenure is hard to draw.

No previous census has reported the number of farms operated by "part owners," "owners and tenants," or "managers," but it is believed that the number conducted by the last-named class is constantly increasing.

FARMS CLASSIFIED BY RACE OF FARMER AND BY TENURE.

TABLE 6.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY RACE OF FARMER AND BY TENURE, WITH PERCENTAGES.

RACE OF FARMER, AND TENURE.	Number of farms.	NUMBER OF ACRES IN FARMS. Average.	Total.	Per cent.	VALUE OF FARM PROPERTY. Total.	Per cent.
The State	155,355	90.0	13,985,014	100.0	$153,591,159	100.0

Managers	3,857	990	246	506	1,559	27.8
Cash tenants	400	84	25	91	328	54.6
Share tenants	463	78	17	79	355	55.7

[1] Includes 20 Indians.

While colored farmers operate more than one-half of all the farms of South Carolina, they control but little over one-fourth of the total acreage, or the value of farm property, and actually own less than one-twelfth of the entire acreage and about one-fourteenth of the total value of farm property.

The values of all forms of farm property are less for colored than for white farmers. The higher per cent of gross income for colored farmers does not indicate superior management, but is due to the smaller average area and consequently more intensive cultivation of their farms, and to the very low average values of their farm property, or capital invested.

Farms operated by managers have the highest average values of all forms of farm property, many of this class being cotton plantations, while some are farms connected with public institutions. The ratio which the gross income bears to the total value of farm property is, however, smaller than for any other group. This is due to the high valuation of the farm property, and the fact that some of them are not cultivated for profit.

FARMS CLASSIFIED BY AREA.

Tables 8 and 9 present the principal statistics for farms classified by area.

TABLE 8.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY AREA, WITH PERCENTAGES.

AREA.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	155,355	90.0	13,985,014	100.0	$153,591,159	100.0
Under 3 acres	1,193	2.0	2,338	(1)	250,841	0.2
3 to 9 acres	13,075	5.8	75,808	0.5	2,639,386	1.7
10 to 19 acres	18,828	13.6	255,815	1.8	5,398,173	3.5
20 to 49 acres	54,384	30.5	1,660,059	11.9	27,978,340	18.2
50 to 99 acres	29,944	67.0	2,005,919	14.3	29,469,508	19.2
100 to 174 acres	20,532	125.4	2,576,058	18.4	31,391,743	20.4
175 to 259 acres	7,866	209.3	1,646,159	11.8	16,235,787	10.6
260 to 499 acres	6,209	345.6	2,145,813	15.4	18,960,100	12.3
500 to 999 acres	2,314	652.0	1,508,769	10.8	10,425,476	6.8
1,000 acres and over	1,010	2,087.4	2,108,276	15.1	10,841,805	7.1

[1] Less than one-tenth of 1 per cent.

TABLE 9.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY AREA.

AREA.	AVERAGE VALUES PER FARM OF—					Per cent of gross income on total investment in farm property.
	Farm property, June 1, 1900.				Gross income (products of 1899 not fed to live stock).	
	Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.		
The State	$642	$174	$43	$130	$402	40.7
Under 3 acres	85	99	7	19	54	25.6
3 to 9 acres	95	69	8	30	86	42.5
10 to 19 acres	155	68	14	50	162	56.7
20 to 49 acres	327	83	21	83	310	60.3
50 to 99 acres	635	169	42	188	466	47.4
100 to 174 acres	1,008	265	66	190	553	36.2
175 to 259 acres	1,355	364	88	257	676	32.8
260 to 499 acres	2,040	525	142	347	897	29.4
500 to 999 acres	3,019	781	192	513	1,154	25.6
1,000 acres and over	7,655	1,684	477	918	2,520	23.5

With a few exceptions, the average values of all forms of farm property increase with the size of the farms. For the group of farms containing less than 3 acres, the average values for land, improvements, and buildings are comparatively high, owing to the fact that many of this group are suburban or summer homes, while a number of them are city dairies and truck farms. The group from 20 to 49 acres includes the largest number of cotton plantations, and the per cent of gross income on total investments is largest for this group.

The average gross incomes per acre for the various groups classified by area are as follows: Farms under 3 acres, $27.43; 3 to 9 acres, $14.78; 10 to 19 acres, $11.96; 20 to 49 acres, $10.15; 50 to 99 acres, $6.96; 100 to 174 acres, $4.41; 175 to 259 acres, $3.23; 260 to 499 acres, $2.59; 500 to 999 acres, $1.77; and 1,000 acres and over, $1.21.

FARMS CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

Tables 10 and 11 present the leading features of the statistics relating to farms classified by principal source of income. If the value of the hay and grain raised on any farm exceeds that of any other crop and constitutes at least 40 per cent of the total value of products not fed to live stock, the farm is classified as a "hay and grain" farm; if vegetables are the leading crop, constituting 40 per cent of the value of products, it is a "vegetable" farm. The farms of the other groups are classified in accordance with the same general principle. "Miscellaneous" farms are those whose operators do not derive 40.0 per cent of their income from any one class of products. Farms with no income in 1899 are classified according to the agricultural operations upon other farms in the same locality.

For the several classes of farms the average values per acre of products not fed to live stock are as follows: For farms whose operators derive their principal income from flowers and plants, $264.29; nursery products, $12.52; vegetables, $10.60; fruit, $6.82; tobacco, $6.27; cotton, $4.94; dairy produce, $4.45; sugar, $3.31; miscellaneous, $3.28; live stock, $3.23; hay and grain, $3.22; and rice, $2.61.

TABLE 10.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME, WITH PERCENTAGES.

PRINCIPAL SOURCE OF INCOME.	Number of farms.	NUMBER OF ACRES IN FARMS.			VALUE OF FARM PROPERTY.	
		Average.	Total.	Per cent.	Total.	Per cent.
The State	155,355	90.0	13,985,014	100.0	$153,591,159	100.0
Hay and grain	9,549	102.9	982,434	7.0	14,465,269	9.4
Vegetables	2,332	63.5	148,062	1.1	2,794,298	1.8
Fruit	189	61.3	11,589	0.1	291,311	0.2
Live stock	3,376	139.8	471,816	3.4	4,766,633	3.1
Dairy produce	442	167.9	74,222	0.5	1,180,499	0.8
Tobacco	1,953	99.9	195,026	1.4	2,312,792	1.5
Cotton	112,822	81.1	9,151,766	65.4	99,843,900	65.0
Rice	1,206	305.2	368,116	2.6	2,775,474	1.8
Sugar	19	97.4	1,850	(1)	16,176	(1)
Flowers and plants	4	3.5	14	(1)	12,515	(1)
Nursery products	3	67.3	202	(1)	5,850	(1)
Miscellaneous	23,460	110.0	2,579,917	18.5	25,126,442	16.4

[1] Less than one-tenth of 1 per cent.

TABLE 11.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY PRINCIPAL SOURCE OF INCOME.

PRINCIPAL SOURCE OF INCOME.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900. Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	Per cent of gross income on total investment in farm property.
The state	$642	$174	$43	$130	$402	40.7
Hay and grain	1,060	272	76	107	331	21.9
Vegetables	763	266	60	109	673	56.2
Fruit	1,072	340	34	95	418	27.1
Live stock	812	309	68	223	452	32.0
Dairy produce	1,471	617	104	479	747	28.0
Tobacco	736	255	53	140	626	52.9
Cotton	579	143	37	126	401	45.3
Rice	1,592	385	143	181	796	34.6
Sugar	443	190	65	153	322	37.8
Flowers and plants	1,975	1,100	54		925	29.6
Nursery products	1,192	675	77	6	843	43.2
Miscellaneous	664	226	46	135	360	33.6

The wide variations shown in the averages and percentages of gross income are largely due to the fact that in computing gross income no deduction is made for expenditures. For florists' establishments, nurseries, and market gardens the average expenditure for such items as labor and fertilizers represents a far larger percentage of the gross income than in the case of "hay and grain," "live-stock," or "miscellaneous" farms. Were it possible to present the average net incomes, the variations shown would be comparatively slight.

FARMS CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

Tables 12 and 13 present data relating to farms classified by the reported value of products not fed to live stock.

TABLE 12.—NUMBER AND ACREAGE OF FARMS, AND VALUE OF FARM PROPERTY, JUNE 1, 1900, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK, WITH PERCENTAGES.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	Number of farms.	NUMBER OF ACRES IN FARMS. Average.	Total.	Per cent.	VALUE OF FARM PROPERTY. Total.	Per cent.
The State	155,355	90.0	13,985,014	100.0	$153,691,159	100.0
$0	871	69.5	60,541	0.4	453,500	0.3
$1 to $49	10,578	22.9	241,877	1.7	2,231,290	1.5
$50 to $99	15,505	30.4	471,888	3.4	4,441,209	2.9
$100 to $249	48,104	49.8	2,393,801	17.1	24,458,080	15.9
$250 to $499	49,940	80.4	4,012,801	28.7	45,792,400	29.8
$500 to $999	22,230	153.8	3,418,045	24.5	42,435,280	27.6
$1,000 to $2,499	6,769	311.9	2,111,580	15.1	26,234,520	17.1
$2,500 and over	1,358	938.5	1,274,481	9.1	7,544,880	4.9

TABLE 13.—AVERAGE VALUES OF SPECIFIED CLASSES OF FARM PROPERTY, AND AVERAGE GROSS INCOME PER FARM, WITH PER CENT OF GROSS INCOME ON TOTAL INVESTMENT IN FARM PROPERTY, CLASSIFIED BY REPORTED VALUE OF PRODUCTS NOT FED TO LIVE STOCK.

VALUE OF PRODUCTS NOT FED TO LIVE STOCK.	AVERAGE VALUES PER FARM OF— Farm property, June 1, 1900. Land and improvements (except buildings).	Buildings.	Implements and machinery.	Live stock.	Gross income (products of 1899 not fed to live stock).	Per cent of gross income on total investment in farm property.
The State	$642	$174	$43	$130	$402	40.7
$0	387	76	13	45		
$1 to $49	133	43	7	28	29	13.5
$50 to $99	175	61	10	40	78	27.2
$100 to $249	323	90	19	76	203	39.9
$250 to $499	611	167	37	112	392	42.8
$500 to $999	1,226	358	84	241	776	40.7
$1,000 to $2,499	2,612	606	195	464	1,450	37.4
$2,500 and over	3,213	908	311	1,124	3,390	61.0

The absence of income in the first group is due in part to the fact that the enumerators could not always secure complete reports for farms where changes in ownership or tenancy had occurred shortly prior to the date of enumeration. The person in charge of such farms, June 1, 1900, could not always give definite information concerning the products of the preceding year. To this extent the reports fall short of giving a complete exhibit of farm income in 1899. Other farms with small reported incomes are doubtless summer resorts or the suburban homes of business or professional men, who derive their principal incomes from other than agricultural pursuits.

LIVE STOCK.

At the request of the various live-stock associations of the country, a new classification of domestic animals was adopted for the census of 1900. The age grouping for neat cattle was determined by their present and prospective relations to the dairy industry and the supply of meat products. Horses and mules are classified by age, and neat cattle and sheep, by age and sex. The new classification permits a very close comparison with previous census reports.

Table 14 presents a summary of live-stock statistics.

The value of all live stock on farms, June 1, 1900, was $20,199,859. Of this amount, 41.7 per cent represents the value of mules; 24.0 per cent, the value of horses; 12.6 per cent, that of dairy cows; 8.9 per cent, that of other neat cattle; 7.0 per cent, that of swine; 4.4 per cent, that of poultry; 0.5 per cent, that of sheep; and 0.9 per cent, that of all other live stock.

No reports were secured of the value of live stock not on farms, but it is probable that such animals have higher average values than those on farms. Allowing the same averages, the value of domestic animals not on farms was $1,096,655, and the total value of live stock in the state, exclusive of poultry and bees not on farms, was approximately $21,296,514.

TABLE 14.—DOMESTIC ANIMALS, FOWLS, AND BEES ON FARMS, JUNE 1, 1900, WITH TOTAL AND AVERAGE VALUES, AND NUMBER OF DOMESTIC ANIMALS NOT ON FARMS.

LIVE STOCK.	Age in years.	ON FARMS. Number.	ON FARMS. Value.	ON FARMS. Average value.	NOT ON FARMS. Number.
Calves	Under 1	87,734	$361,454	$4.12	2,580
Steers	1 and under 2	14,975	95,827	6.40	466
Steers	2 and under 3	8,157	74,544	9.14	288
Steers	3 and over	19,118	315,707	16.51	613
Bulls	1 and over	10,116	125,621	12.42	153
Heifers	1 and under 2	33,879	291,705	8.61	888
Cows kept for milk	2 and over	126,684	2,541,723	20.06	9,649
Cows and heifers not kept for milk.	2 and over	42,235	528,133	12.50	622
Colts	Under 1	2,701	69,778	25.83	80
Horses	1 and under 2	3,188	161,587	50.69	97
Horses	2 and over	72,530	4,615,538	63.64	9,678
Mule colts	Under 1	520	18,937	36.42	32
Mules	1 and under 2	3,081	187,207	60.76	41
Mules	2 and over	113,768	8,209,379	72.16	2,759
Asses and burros	All ages	247	22,353	90.50	54
Lambs	Under 1	19,102	25,365	1.33	113
Sheep (ewes)	1 and over	40,478	66,202	1.64	217
Sheep (rams and wethers).	1 and over	11,958	20,203	1.69	192
Swine	All ages	618,995	1,411,516	2.28	12,030
Goats	All ages	26,576	24,450	0.92	681
Fowls:[1]					
Chickens[2]		2,664,784			
Turkeys		120,140	889,953		
Geese		83,543			
Ducks		39,852			
Bees (swarms of)		93,958	142,677	1.52	
Value of all live stock			20,199,859		

[1] The number reported is of fowls over three months old. The value is of all, old and young.
[2] Including Guinea fowls.

CHANGES IN LIVE STOCK ON FARMS.

The following table shows the changes since 1850 in the number of the most important domestic animals:

TABLE 15.—NUMBER OF SPECIFIED DOMESTIC ANIMALS ON FARMS: 1850 TO 1900.

YEAR.	Dairy cows.	Other neat cattle.	Horses.	Mules and asses.	Sheep.[1]	Swine.
1900	126,684	216,214	78,419	117,616	52,436	618,995
1890	107,184	161,109	59,888	86,306	79,421	494,696
1880	139,881	223,828	60,660	67,005	118,889	628,198
1870	98,693	150,610	44,105	41,327	124,594	395,999
1860	163,938	342,838	81,125	56,456	233,509	965,779
1850	193,244	584,442	97,171	37,483	285,551	1,065,503

[1] Lambs not included.

In South Carolina, as in most states of this section, the rearing of live stock is but an auxiliary to the other branches of agriculture, and horses and mules exceed all other classes in importance. Since the Civil War the character of general farming industries has so changed in the Atlantic states that the raising of meat-producing stock has been transferred to the West. Each class, except mules and asses, shows fewer numbers in 1900 than in 1850, although for the decade preceding 1900 considerable increases are shown in the numbers of all classes except sheep. The number of sheep has decreased steadily since 1850, the number reported in 1900 being 34.0 per cent less than that in 1890. All other classes show fluctuations in number since 1850. For the last decade the following increases are shown: Dairy cows, 18.2 per cent; other neat cattle, 34.2 per cent; horses, 30.9 per cent; mules and asses, 36.3 per cent; and swine, 25.1 per cent.

In 1900 the enumerators were instructed to report no fowls under three months old, a limitation not made in former census years. This accounts, in part at least, for the following apparent decreases in numbers of all domestic fowls for the decade 1890 to 1900: Geese, 31.3 per cent; chickens, 31.2 per cent; turkeys, 19.4 per cent; ducks, 15.4 per cent. That this decrease is only apparent is indicated by the large increase in the production of eggs for the same decade.

ANIMAL PRODUCTS.

Table 16 presents a summary of animal products for 1899.

TABLE 16.—QUANTITIES AND VALUES OF SPECIFIED ANIMAL PRODUCTS, AND VALUES OF POULTRY RAISED, ANIMALS SOLD, AND ANIMALS SLAUGHTERED ON FARMS IN 1899.

PRODUCTS.	Unit of measure.	Quantity.	Value.
Wool	Pounds	175,290	$31,537
Mohair and goat hair	Pounds	73	26
Milk	Gallons	[1] 44,031,528	
Butter	Pounds	8,150,437	[2] 3,232,725
Cheese	Pounds	1,081	
Eggs	Dozens	9,007,700	925,966
Poultry			1,539,755
Honey	Pounds	872,590	92,857
Wax	Pounds	37,500	
Animals sold			823,554
Animals slaughtered			2,730,079
Total			9,376,499

[1] Includes all milk produced, whether sold, consumed, or made into butter or cheese.
[2] Includes the value of all milk sold or consumed and of butter and cheese made.

The value of animal products for 1899 was $9,376,499, or nearly half as great as the value of all live stock on farms, June 1, 1900, and 13.7 per cent of the value of all farm products for the year 1899. Of this amount, 37.9 per cent represents the value of animals sold and animals slaughtered on farms; 34.5 per cent, the value of dairy produce; 26.3 per cent, the value of poultry and eggs; 1.0 per cent, the value of honey and wax; and 0.3 per cent, the value of wool, mohair, and goat hair.

ANIMALS SOLD AND ANIMALS SLAUGHTERED.

In 1899 the value of animals sold and animals slaughtered on farms was $3,553,633, or 5.2 per cent of all farm products. Animals slaughtered were reported by 94,302 farmers, or 60.7 per cent of all in the state, the average value per farm being $28.95. Sales of live animals were reported by 29,784 farmers, or 19.2 per cent of the whole number, the average receipts per farm being $27.65.

In obtaining these reports the enumerators were instructed to obtain from each farm operator a statement of the amount received from the sale of live animals in 1899, less the amount paid for animals purchased during the same year.

DAIRY PRODUCE.

Of the $3,232,725 given in Table 16 as the value of dairy produce, $2,890,342, or 89.4 per cent, represents the value of such produce consumed on farms, and $342,383, or 10.6 per cent, the amount received from sales. Of the latter amount, $195,939 was received from the sale of 1,103,637 pounds of butter; $141,737, from 1,186,045 gallons of milk; $4,657, from 4,796 gallons of cream; and $50, from 800 pounds of cheese.

The production of milk in the last decade increased 84.7 per cent and that of butter made on farms 42.1 per cent, while a decrease of 56.3 per cent is shown in the amount of cheese made on farms.

POULTRY, EGGS, HONEY AND WAX, AND WOOL.

Of the value of poultry products in 1899, 62.4 per cent represents the value of poultry raised, and 37.6 per cent that of eggs produced. The production of eggs in 1899 was 58.0 per cent greater than in 1889. The census of 1899 compared with that of 1889 shows increases of 1.9 per cent in the production of honey, and 35.2 per cent in that of wax. The production of wool in 1899 was 11.1 per cent greater than in 1889, but this increase is probably only apparent, as the fleeces from a large number of sheep were omitted from the tables in 1890, but included in a general estimate of wool shorn after the census enumeration. Horry and Berkeley counties together reported about one-sixth of the state total.

HORSES, MULES, AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS.

Table 17 presents, for the leading groups of farms, the number of farms reporting horses, mules, and dairy cows, and the average number of these animals per farm. In computing the averages presented, only those farms which report the kind of stock under consideration are included.

In South Carolina, as in other states where cotton is a staple crop, and much of the farm labor is performed by negroes, large numbers of mules are used as work animals. For most classes of farms the average number of mules and horses are about equal, but on farms operated by managers, and on farms of the largest area, more mules than horses are reported. This is due to the fact that these two classes include a relatively large number of cotton plantations.

If the number of horses and mules be combined, the average number of work animals per farm compares favorably with the corresponding figures for the more intensively cultivated farms of New England.

TABLE 17.—HORSES, MULES, AND DAIRY COWS ON SPECIFIED CLASSES OF FARMS, JUNE 1, 1900.

CLASSES.	HORSES.		MULES.		DAIRY COWS.	
	Farms reporting.	Average per farm.	Farms reporting.	Average per farm.	Farms reporting.	Average per farm.
Total	58,541	1.3	75,428	1.6	81,483	1.6
White farmers	35,658	1.4	39,635	1.9	47,356	1.8

Hay and forage	106,124	Tons	213,249	2,304,734
Sea-island cotton seed		Tons	[1]3,607	48,200
Upland cotton seed		Tons	[2]410,459	4,925,201
Sea-island cotton	23,902	Bales[3]	9,209	664,559
Upland cotton	2,050,179	Bales[4]	872,213	28,925,593
Tobacco	25,993	Pounds	19,895,970	1,297,293
Peanuts	7,162	Bushels	131,710	106,018
Dry beans	1,657	Bushels	14,925	13,936
Dry pease	143,070	Bushels	1,162,705	859,932
Potatoes	8,068	Bushels	651,916	435,468
Sweet potatoes	48,831	Bushels	3,369,957	1,538,205
Onions	147	Bushels	16,172	11,312
Miscellaneous vegetables	40,624			2,079,862
Sugar cane	7,342	Tons	73,702	
(a) cane sold		Tons	3,585	13,582
(b) cane kept for seed		Tons	29,368	102,788
(c) sugar made		Pounds	49,590	2,256
(d) molasses and sirup made.		Gallons	805,064	310,799
Sorghum cane	7,250	Tons	[5]3,589	10,285
Sorghum sirup		Gallons	478,190	168,038
Small fruits	591			59,486
Grapes	[6]638	Centals	33,238	[7]82,706
Orchard fruits	[6]28,587			[8]272,794
Tropical fruits				1,147
Nuts				3,868
Forest products				1,915,134
Flowers and plants	28			7,920
Seeds	9			505
Nursery products	84			4,416
Miscellaneous	28			749
Total	4,751,385			58,890,413

[1] Exclusive of 1,000 tons, valued at $13,365, sold in seed cotton and included with the cotton.
[2] Exclusive of 8,219 tons, valued at $98,623, sold in seed cotton and included with the cotton.
[3] Average weight, 336 pounds.
[4] Average weight, 480 pounds.
[5] Sold as cane.
[6] Estimated from number of vines and trees.
[7] Including value of raisins, wine, etc.
[8] Including value of cider and vinegar.

Of the total value of crops, cotton, including seed, contributed 58.7 per cent; cereals, including rice, 21.6 per cent; hay and forage, 3.9 per cent; miscellaneous vegetables, 3.5 per cent; forest products, 3.3 per cent; sweet potatoes, 2.6 per cent; tobacco, 2.2 per cent; dry pease, 1.5 per cent; potatoes, 0.7 per cent; and all other products, 2.0 per cent.

The average values per acre of the various crops are as follows: Flowers and plants, $283; onions, $77; potatoes, $54; nursery products, $53; miscellaneous vegetables, $51; tobacco, $50; sweet potatoes, $32; hay and forage, $22; cotton, including seed, $17; peanuts, $15; orchard fruits, $10; cereals, $6; and dry pease, $6. The crops yielding the highest average returns per acre were grown upon very highly improved land. Their production required a relatively great amount of labor, and large expenditures for fertilizers.

COTTON.

The following table is a statement of the changes in cotton production since 1879:

TABLE 19.—ACREAGE AND PRODUCTION OF COTTON: 1879 TO 1899.

YEAR.	ACREAGE.		PRODUCTION.		
	Total.	Per cent of increase.	Commercial bales.	Pounds.	Per cent of increase.
1899	2,074,081	4.4	881,422	421,862,069	18.4
1889	1,987,469	45.7	747,190	356,409,630	50.6
1879	1,364,249	....	522,548	236,714,244	....

In 1849 South Carolina produced 300,901 bales of cotton, and in 1859, 353,412 bales, an increase of 17.5 per cent. The census of 1870 found the cotton crop in this, as in other states, suffering from the effects of the Civil War, the production in 1869 amounting to only 224,500 bales, or 36.5 per cent less than that of 1859. In the following decade the production of cotton more than doubled, while the decade from 1879 to 1889 showed an increase of 43.0 per cent.

In 1899, 134,741 farmers devoted an area of 2,074,081 acres to the cultivation of cotton, an average of 15.4 acres per farm, and 35.9 per cent of the total improved farm land. From this land was produced a total crop of 421,862,069 pounds of cotton, an average of 3,131 pounds per farm, 203 pounds per acre, 13,983 pounds per square mile of land surface, and 315 pounds per capita. Of the total production 99.2 per cent was upland cotton, and the remaining 0.8 per cent was sea-island cotton.

The total value of the crop, including the value of cotton seed, was $34,563,553, an average of $256.52 per farm, $16.66 per acre, and $25.79 per capita. Of the total value, $28,925,593 was the value of the upland cotton, $664,559, that of sea-island cotton, and $4,973,401, that of cotton seed. The total value represents 55.3 per cent of the gross farm income.

The counties reporting the largest area under cotton were Anderson, Orangeburg, Laurens, Abbeville, Sumter, and Spartanburg, ranking in the order named, and reporting 30.0 per cent of the total acreage. These counties, which are located in the central and northwestern parts of the state, were seeded to upland cotton, while sea-island cotton was grown almost entirely in the counties adjacent to the coast.

CEREALS.

Table 20 is a statement of the changes in cereal production since 1849.

TABLE 20.—ACREAGE AND PRODUCTION OF CEREALS: 1849 TO 1899.

PART 1.—ACREAGE.

YEAR.[1]	Barley.	Corn.	Oats.	Rice.	Rye.	Wheat.
1899	281	1,772.057	222,544	77,657	4,256	174,245
1889	688	1,345,990	308,056	42,238	4,129	115,510
1879	1,162	1,303,404	261,445	78,388	7,152	170,902

PART 2.—BUSHELS PRODUCED.[2]

YEAR.	Barley.	Corn.	Oats.	Rice.	Rye.	Wheat.
1899	3,106	17,429,610	2,661,670	47,360,128	19,372	1,017,319
1889	9,428	13,770,417	3,019,119	30,338,951	17,303	658,351
1879	16,257	11,767,099	2,715,505	52,077,515	27,049	962,358
1869	4,752	7,614,207	613,593	32,304,825	36,165	783,610
1859	11,490	15,065,606	936,974	119,100,528	89,091	1,285,631
1849	4,583	16,271,454	2,322,155	159,930,613	43,790	1,066,277

[1] No statistics of acreage were secured prior to 1879.
[2] Rice reported in pounds.

The total area devoted to cereals in 1879 was 1,822,453 acres; in 1889, 1,816,676 acres; and in 1899, 2,251,050 acres, an increase for the twenty years of 23.5 per cent. The acreage given for 1889 includes 65 acres devoted to buckwheat, and that for 1899 includes 10 acres. The increases in the areas devoted to the various cereals in the decade from 1889 to 1899 were: Rice, 83.9 per cent; wheat, 50.8 per cent; corn, 31.7 per cent; and rye, 3.1 per cent. The decreases were: Barley, 59.2 per cent; and oats, 27.8 per cent.

Exclusive of rice, the total number of bushels of cereals, including buckwheat, reported in 1849 was 19,708,542, and for 1899, 21,131,118, an increase of 7.2 per cent in the half century. The production of rice shows a decrease in the same time of 70.4 per cent.

Of the total area under cereals in 1899, 78.7 per cent was devoted to corn; 9.9 per cent, to oats; 7.7 per cent, to wheat; and 3.7 per cent, to barley, buckwheat, rice, and rye.

Barley, corn, oats, rye, and wheat are reported from nearly all parts of the state. Rice was grown in 35 counties, but 60.0 per cent of the acreage was furnished by the four counties of Georgetown, Colleton, Beaufort, and Berkeley, in the extreme southeastern part of the state.

HAY AND FORAGE.

In 1900, 87,777 farmers, or 56.5 per cent of the total number, reported hay or forage crops. Exclusive of cornstalks and corn strippings, they obtained an average yield of 1.03 tons per acre. The acreage in hay and forage in 1899 was 106,124 acres, or 264.3 per cent greater than ten years before, 46.1 per cent of this acreage producing grains cut green for hay.

In 1899 the acreages and yields of the various kinds of hay and forage were as follows: Wild, salt, and prairie grasses, 954 acres and 985 tons; millet and Hungarian grasses, 474 acres and 806 tons; alfalfa or lucern, 18 acres and 31 tons; clover, 1,435 acres and 1,728 tons; other tame and cultivated grasses, 50,733 acres and 51,608 tons; grains cut green for hay, 48,918 acres and 47,912 tons; crops grown for forage, 3,592 acres and 5,816 tons; cornstalks and corn strippings, 497,527 acres and 104,363 tons.

In Table 18 the production of cornstalks and corn strippings is included under "hay and forage," but the acreage is included under "corn," as the forage secured was only an incidental product of the corn crop.

ORCHARD FRUITS.

The changes in orchard fruits since 1890 may be seen in the following table:

TABLE 21.—ORCHARD TREES AND FRUITS: 1890 AND 1900.

FRUITS.	NUMBER OF TREES.		BUSHELS OF FRUIT.	
	1900	1890	1899	1889
Apples	694,700	321,137	251,728	435,484
Apricots	2,397	2,099	120	2,057
Cherries	95,288	21,329	6,551	10,173
Peaches	1,136,790	711,138	129,472	1,490,633
Pears	72,846	12,720	20,439	9,244
Plums and prunes	99,209	20,383	16,177	8,507

The total number of fruit trees in the state in 1890 was 1,088,806, and in 1900, 2,123,968, an increase of 1,035,162, or 95.1 per cent. The increases are as follows: Pear trees, over five times; cherry, plum and prune trees, over four times; apple trees, 116.3 per cent; and peach trees 59.9 per cent.

Of the total number in 1900, 53.5 per cent were peach trees; 32.7 per cent, apple trees; 3.4 per cent, pear trees; 4.7 per cent, plum and prune trees; and 5.7 per cent, cherry, apricot, and unclassified fruit trees. The last-named class, which is not included in the table, numbered 22,738 and yielded 7,686 bushels of fruit.

The value of orchard fruits given in Table 18 includes the value of 575 barrels of cider, 259 barrels of vinegar, and 21,140 pounds of dried and evaporated fruits. Comparisons of yields or of their values, when made by decades only, have little significance, as the yield of any given year is largely due to the nature of the season.

TROPICAL FRUITS AND NUTS.

In 1899, 2,537 farms produced 74,050 pounds of figs from 7,109 trees. There were reported 9,959 pecan trees, yielding 13,020 pounds of nuts; 566 Persian or English walnut trees, yielding 1,500 pounds; and 3,704 unclassified nut-bearing trees, yielding 3,976 pounds. The total value of the fig crop was $1,147, and that of nuts, $3,868.

SMALL FRUITS.

There were but 591 acres devoted to small fruits in 1899. Strawberries occupied 499 acres, or 84.4 per cent of the total area, and yielded 845,695 quarts. More than half of the acreage in this fruit was reported from Charleston county. The acreages and productions of other berries were as follows: Blackberries and dewberries, 39 acres and 50,960 quarts; raspberries and Logan berries, 4 acres and 4,150 quarts; currants, 2 acres and 2,290 quarts; and other small fruits, 47 acres and 55,790 quarts.

SUGAR CANE.

Table 22 presents a comparative statement of the acreage of cane, and the production of sugar and sirup: 1849 to 1899.

TABLE 22.—ACREAGE OF SUGAR CANE, AND PRODUCTION OF SUGAR AND SIRUP: 1849 TO 1899.

YEAR.[1]	Acreage in cane.	SUGAR.		SIRUP.	
		Production in pounds.	Average yield per acre in pounds.	Production in gallons.	Average yield per acre in gallons.
1899	7,342	49,590	6.8	805,064	109.7
1889	3,305	219,980	66.6	386,615	117.0
1879	1,787	274,800	153.8	138,944	77.8
1869	....	1,266,000	....	....	....
1859	....	237,600	....	....	....
1849	....	805,200	....	....	....

[1] No statistics of acreage were secured prior to 1879.

The present census shows that in 1899 sugar cane was grown by 18,776 farmers on 7,342 acres, an average of 0.4 of an acre for each farm reporting. From this area they sold 3,585 tons of cane for $13,582, and from the remaining product manufactured 49,590 pounds of sugar, valued at $2,256, and 805,064 gallons of molasses and sirup, valued at $310,799. This was an increase in acreage of 122.1 per cent, and in the production of molasses and sirup of 108.2 per cent, but a decrease in the production of sugar of 77.5 per cent.

The total value of sugar-cane products was $429,425, an average of $22.87 for each farm reporting and of $58.49 per acre. The average value of sugar was 4.5 cents per pound and the average value of molasses and sirup was 38.6 cents per gallon.

The crop was grown in 24 counties of the state. The largest production of sugar, 18,990 pounds, was reported from Colleton county; the largest quantity of sirup, 189,642 gallons, was made in Orangeburg county. The latter county also leads in the total value of products, the value reported for 1899 being $91,578. Barnwell county ranks second, with 108,779 gallons of sirup, valued at $45,821.

In addition to the above figures, it is estimated that 29,368 tons of cane, valued at $102,788, were kept for seed.

SORGHUM CANE.

In 1899 sorghum cane was grown by 18,332 farmers on 7,250 acres, from which area they sold 3,589 tons of cane for $10,285, and from the remaining product manufactured 478,190 gallons of sirup, valued at $168,038. This was a decrease in acreage since 1889 of 36.4 per cent. The total value of sorghum-cane products was $178,323, an average of $9.73 for each farm reporting, and of $24.60 per acre.

TOBACCO.

The tobacco crop in South Carolina during the last forty years has fluctuated greatly. In 1849 the state produced 74,285 pounds of tobacco; in 1859, 104,412 pounds; and in 1869, 34,805 pounds. Between 1869 and 1879 there was an increase in the amount produced of 10,873 pounds, or 31.2 per cent; and between 1879 and 1889, a gain of 177,220 pounds, or 388.0 per cent.

The present census shows that tobacco was grown in South Carolina by 6,744 farmers, who obtained from 25,993 acres a yield of 19,895,970 pounds, valued at $1,297,293. This was an increase over the crop area of 1889 of 25,599 acres, or over sixty times, and in production of 19,673,072 pounds, or nearly ninety times. The average yield per acre in the state in 1899 was 765 pounds, against 566 pounds in 1889, and 270 pounds in 1879. The average value was 6.5 cents per pound.

Tobacco is grown in 33 counties in the state. The leading county in acreage and production in 1899 was Marion, with Darlington county second. These two counties furnished 55.1 per cent of the acreage and 56.4 per cent of the crop of the state. Next in order were Florence, Horry, and Clarendon counties. These five leading counties together furnished 85.4 per cent of the acreage, and 86.5 per cent of the production of the state.

PEANUTS.

Peanuts were grown in 1899 by 6,123 farmers, who devoted to the crop 7,162 acres, and secured a product of 131,710 bushels. The average yield per acre was 18.4 bushels, and the average value per acre, approximately, $15. Of the total acreage, 73.2 per cent lies in Bamberg, Horry, Colleton, Hampton, Orangeburg, and Beaufort counties.

Increases of 178.4 per cent in acreage and 208.0 per cent in production are shown for the last decade.

VEGETABLES.

The total value of vegetables grown in 1899, including potatoes, sweet potatoes, and onions, was $4,064,847, of which 51.2 per cent represents the value of miscellaneous vegetables; 37.8 per cent, that of sweet potatoes; 10.7 per cent, that of potatoes; and 0.3 per cent, that of onions.

Sweet potatoes were grown in 1899 by 79,145 farmers, or 50.9 per cent of the total number in the state. The area devoted to this crop in 1889 was 46,086 acres, and in 1899, 48,831 acres, a gain of 6.0 per cent.

In the growing of miscellaneous vegetables, 40,624 acres were used. Of this area the products of 24,005 acres were not reported in detail. Of the remaining 16,619 acres, 10,511 acres were devoted to watermelons; 2,562 acres, to cabbages; 1,037 acres, to muskmelons; 800 acres, to cucumbers; 602 acres, to beans; 403 acres, to asparagus; 317 acres, to tomatoes; and 387 acres, to other vegetables.

FLORICULTURE.

The area devoted to the cultivation of flowers and ornamental plants in 1899 was 28 acres, and the value of products sold therefrom was $7,920. These flowers and plants were grown by 28 farmers and florists, of whom 4 made commercial floriculture their principal business. The capital invested in land, buildings, and implements was $12,515, of which $4,400 represents the value of the buildings. Their sales of flowers and plants amounted to $3,700. They expended for labor $550, and for fertilizers, $180. The average gross income for each farm reporting was $925.

In addition to the 4 principal establishments, 79 farms and market gardens made use of glass in the propagation of flowers, plants, or vegetables. They had an area under glass of 21,833 square feet, making, with the 8,377 square feet belonging to the florists' establishments, a total of 30,210 square feet.

NURSERIES.

The total value of nursery stock sold in 1899 was $4,416, reported by the operators of 34 farms and nurseries, of whom 3 derived their principal income from the nursery business. They had 202 acres of land, and a capital invested in land, buildings, implements, and live stock of $5,850.

Their total income was $2,530, of which $2,430 represents the value of nursery stock, and $100, that of other products. The expenditure for labor was $1,100, and for fertilizers, $110. The average gross income for each farm reporting was $843.

LABOR AND FERTILIZERS.

The total expenditure for labor on farms in 1899, including the value of board furnished, was $6,107,100, an average of $39 per farm. The average expenditure was $367 for nurseries, $138 for florists' establishments, $126 for dairy farms, $96 for tobacco farms, $95 for vegetable farms, $65 for rice farms, $56 for hay and grain farms, $39 for fruit farms, $37 for cotton farms, $36 for live-stock farms, and $26 for sugar farms.

"Managers" expended on an average, $507; "owners," $62; "cash tenants," $23; and "share tenants," $17. White farmers expended $70 per farm and colored farmers, $14.

Fertilizers purchased in 1899 cost $4,494,410, an average of $29 per farm and an increase since 1890 of 16.2 per cent. The average expenditure was $66 for tobacco and for vegetable farms, $45 for florists' establishments, $37 for nurseries, $34 for dairy farms, $33 for hay and grain farms, $29 for cotton farms, $22 for live-stock farms, $21 for fruit farms, $17 for rice farms, and $9 for sugar farms.

IRRIGATION STATISTICS.

The beginning of irrigation in South Carolina was contemporaneous with the introduction of rice growing, the irrigation systems being similar to those now in use. Rice was first planted in 1700, and from that time until 1861 South Carolina ranked first among the states in its production. Changed labor conditions since the war, and the great expense of maintenance, due to the destruction of dikes, and the total loss of crops by floods, which are frequent since the deforestation of the mountain slopes, have operated against the growth of this industry, and rice culture has not made the progress here that it has in a few other states.

Rice is irrigated in South Carolina by manipulating river waters through trunks built in the dikes which protect the low marsh lands from the rivers. The delta lands are selected with reference to the possibility of flooding from the rivers with fresh water at high tide, and of draining them at low tide. The reclamation of these lands necessitates the building, parallel with the river, of costly dikes, capable of resisting the force of the flood tide, and also that of the river in time of freshets. After the dikes are built, the field is divided into sections or squares by similar banks, called "check" banks. These squares contain from 5 to 30 acres each, and in turn are subdivided by ditches into beds, usually about thirty-five feet wide and extending the length of the square. Each of these squares has a wooden trunk with a door at each end, through which the water is admitted to the field. The trunks are from 30 to 40 feet long, from 3 to 12 feet wide, and about sixteen inches deep, and are built under the dikes on a level with the bed of the ditches. In flooding the field the outer door is raised and the inner closed. As the tide rises the water comes in through the trunk, pushes the field door open, and passes through the ditches to the field. When the tide falls in the river, the pressure of the water in the field closes the inner swinging door against the muzzle of the trunk, thus holding the water. In draining the field this method is reversed, the field door being raised at low tide and the outer door dropped. The unlimited supply of fresh water and its perfect control by this system of flooding and draining account for the superior quality of rice for which South Carolina is famous.

The practice of dumping the harbor dredgings into the river above Savannah has injured the system of drainage, causing the abandonment of a number of rice plantations along the Savannah River. On many plantations which formerly were readily drained at low tide, pumping is now resorted to when the rivers are high, as the fields can not properly be drained. The pumps, which are mounted on flats or lighters, are operated by steam and shifted on the river from field to field. The suction pipe is dropped over the dike into any desired field and the water pumped into the river.

Rice is grown inland on low, swampy lands, which are flooded from reservoirs or small streams. The cultivation of upland or "Providence" rice is attempted in many of the interior counties, but owing to the low yield and an occasional total failure the results are not satisfactory. Orangeburg county has the largest crop of upland rice, and in 1899 produced 2,266,162 pounds, an average yield of 309 pounds per acre. The irrigated crop is sure as compared with that of the uplands, the average yield per acre being much higher, and the quality of rice far superior.

Tide-water irrigation is generally practiced in Beaufort, Berkeley, Colleton, Charleston, Georgetown, and Hampton counties. In 1899 the rice acreage of these counties, irrigated and upland, was 70.0 per cent of the total, while the production, 40,651,664 pounds, was 86.0 per cent of the total rice crop of the state. The average yield per acre was 748 pounds. The total product of all other counties was 6,708,464 pounds, an average of 288 pounds per acre.

It is impossible to ascertain the exact cost of reclaiming these delta lands. Rice irrigation was reported on 648 plantations; the acreage was 29,690, and the yield, 33,467,191 pounds. The average first cost per acre for preparing rice lands for irrigation, inclusive of cost of construction of dikes, trunks, check banks, and ditches, is estimated to be $28.68, and the systems in use represent a total investment of over $851,509.
